The second point in Dr. Ingals' review states: "It is claimed that nearly all cases of asthma are the result of disease in the nasal cavities." I very distinctly stated in the introduction to and in the course of my paper, that the only form of asthma which I wished to consider was that perennial form which is more or less independent of the seasons, and not complicated with organic disease, etc., namely,—"Asthma nervosum seu essentiale." This is, comparatively speaking, a rarer form of asthma (vide Niemeyer's Spec. Path. and Therap., 10th ed.), and clearly show that this is by no means so. I said: therefore the reproach quoted above falls to the ground.

> Dr. Ingals' third point is: "It is also claimed that Very truly yours,

ASSOCIATION ITEMS.

AMERICAN MEDICAL ASSOCIATION.

The Thirty-eighth Annual Session will be held in Chicago, Ill., on Tuesday, Wednesday, Thursday and Friday, June 7, 8, 9 and 10, commencing on Tuesday, at 11 A.M.

"The delegates shall receive their appointment and such County and District Medical Societies as are recognized by representation in their respective State Societies, and from the Medical Department of the Army and Navy, and the Marine Hospital Ser-

"Each State, County, and District Medical Soci-

ten of its regular resident members, and one for every additional fraction of more than half that number: Provided, however that the number of delegates for any particular State, territory, county, city or town shall not exceed the ratio of one in ten of the resident physicians who may have signed the Code of Ethics of the Association.'

Secretaries of Medical Societies, as above designated, are earnestly requested to forward, at once,

lists of their delegates.

Also, that the Permanent Secretary may be enabled to erase from the roll the names of those who have forfeited their membership, the Secretaries are, by special resolution, requested to send to him, annually, a corrected list of the membership of their respective Societies.

SECTIONS.

"The Chairmen of the several Sections shall prepare and read, in the general sessions of the Association, papers on the advances and discoveries of the \$1.50 a day. past year in the branches of science included in their respective Sections. . . " By-Laws, Art. II, Sec. 4.

Practice of Medicine, Materia Medica and Physiologr.—Dr. J. S. Lynch, Baltimore, Md., Chairman; Dr. J. B. Marvin, Louisville, Ky., Secretary.

Obstetries and Diseases of Women and Children .-Dr. F. M. Johnson, Kansas City, Mo., Chairman; Dr. W. W. Jaggard, Chicago, Ill., Secretary.

Surgery and Anatomy.—Dr. H. H. Mudd, St. Louis, Mo., Chairman; Dr. A. M. Pollock, Pitts-

burg, Pa., Secretary. State Medicine.—Dr. George H. Rohé, Baltimore, Md., Chairman; Dr. Walter Wyman, U. S. M. Hos-

pital, New York, Secretary.

Ophthalmology, Otology and Laryngology.—Dr. X. C. Scott, Cleveland, O., Chairman; Dr. J. H. Thompson, Kansas City, Mo., Secretary.

Diseases of Children .- Dr. DeLaskie Miller, Chicago, Ill., Chairman; Dr. W. B. Lawrence, Bates-

ville, Ark., Secretary.

Oral and Dental Surgery.—Dr. John S. Marshall, Chicago, Ill., Chairman; Dr. A. E. Baldwin, Chicago, Ill, Secretary.

Medical Jurisprudence.—Dr. I. N. Quimby, Jersey City, N. J., Chairman; Dr. H. H. Kumball, Minne-

apolis, Minn., Secretary.

A member desiring to read a paper before a Section should forward the paper, or its title and length (not exceeding twenty minutes in reading), to the Chairman of the Committee of Arrangements at least one month before the meeting.—By-Laws.

Committee of Arrangements.—Dr. Charles Gilman

Smith, Chicago, Ill., Chairman.

Amendment to By Laws.—Create a new Section, to be known as the Section on Dermatology and Venereal Diseases. WM. B. ATKINSON, M.D.,

Permanent Secretary.

Philadelphia, 1400 Pine St., S. W. cor. Broad.

CHICAGO COLLEGE OF PHARMACY.—At the recent annual meeting of the College, George Buck was elected President; Judson S. Jacobus, Treasurer; and D. H. Galloway, Secretary.

INTERNATIONAL CONGRESS.

NINTH INTERNATIONAL MEDICAL CON-GRESS.

In reference to demands from various quarters for information as to hotel rates here in Washington, and what arrangements have been made for a reduction of the same, by our committee, in favor of those who will attend the International Medical Congress, I beg to announce the following seale of prices:

The Arlington Hotel, from \$3 to \$3.50 per day. Riggs House, from - - \$3 to \$3.50 per day. Willard's Hotel, from - \$3 to \$3.50 per day. Metropolitan Hotel, - - - \$3.00 per day. National Hotel, - - - - \$3.00 per day.

Other hotels, conducted on European style, will furnish rooms at from \$1 to \$2 a day. First-class lodging houses will also furnish rooms from \$1 to A. Y. P. GARNETT, M.D.,

Ch'n Com. of Arr. Int. Mcd. Congress. 1319 New York Ave., Washington, D. C., March 14, 1887.

Since the statement concerning reduced rates on the transatlantic steamers, given in this journal for Feb. 26, page 241, we have been officially informed by the Committee of Arrangements that, in addition to the steamship lines then given, the North German Lloyd Line has agreed to give physicians and members of their families the round trip from Bremen to New York and return at \$187.50, and the Cunard Line agrees to deduct ten per cent. from usual rates for members of the Congress only.

We are further authorized to state that Albaugh's and the National Theatre and Willard's Hall, in Washington, have been secured for the use of the Congress. The last-named will be headquarters and

the place of registration.

Congress, before its recent adjournment, appropriated \$10,000 from the National Treasury to aid in defraying the necessary expenses of the Medical Congress.—Editor.

MISCELLANEOUS.

WESTERN RESERVE UNIVERSITY.—A very elegant and complete new building for the Medical Department of Western Reserve University in Cleveland, Ohio, had been completed and was formally dedieated on the evening of March 8, 1887. The entire cost, about \$175,000, was the donation of Mr. John L. Woods, a wealthy and liberal citizen of that city.

NOTES AND ANSWERS. ARMY SURGEONS ON SICK LEAVE.

Sir:—An answer to the following question will be highly appreciated: Can an Assistant Surgeon U. S. A. on sick leave practice medicine in the town where his home is, hold a State position, and keep a drug store, all at the same time?

INQUIRER.

Key West, Fla., March 7, 1887.

We are not familiar with the Army regulations concerning the rights and duties of Assistant Surgeons on sick leave. Will some reader give "Inquirer" a correct answer?—Editor.

DEEP TUBING OF THE LARYNX AS A SUBSTITUTE facts relative to the subsequent behavior of the pa-FOR INTUBATION.

With a Report of Nine Cases and Presentation of New Instruments.

Read before the Chicago Medical Society, March 7, 1887. BY A. E. HOADLEY, M.D.,

PROFESSOR OF ANATOMY, CHICAGO COLLEGE OF PHYSICIANS AND SCR-GRONS, PROFESSOR OF SURGERY IN THE CHICAGO POLICLINIC, ETC.

In April, 1886, I became convinced that intubation of the larynx was a justifiable surgical procedure, and a valuable substitute for tracheotomy in selected cases. I therefore procured a set of the O'Dwyer instruments and tubes. Although I had handled the tubes and seen them introduced, and a year previous had introduced them myself on the cadaver, I did not until this time give serious consideration to the position of the tube after the introduction. I had no difficulty in coming to a conclusion in this matter. From my knowledge of the larynx, and the contour of the head of the tube, I decided that the head of the tube was designed to rest within the larynx, with its projecting flange resting upon the false vocal cords, with the straight part of the tube behind resting against the posterior straight wall of the larynx. (Fig. 1.)

It was not until I had in this manner tubed five cases that I was informed that it was not the design and found it necessary to tube immediately. I have not as yet had an opportunity of watching the patients as closely as I could desire, and for the main tients I am indebted to the physician in attendance. Of the two cases above referred to, I saw one six hours after the operation. She was perfectly comfortable as far as breathing and wearing the tube were concerned. The other died twelve hours after the operation, before I saw her a second time.

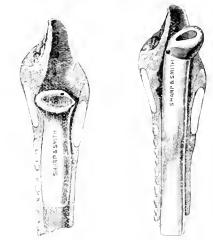

Fig. r.-Deep tubing.

The ages of the patients ranged from 2 to 6 years. of the inventor, Dr. O'Dwyer, to have the head of All had diphtheritic laryngeal stenosis. They were the tube rest within the larynx, but on the contrary all bad cases and all died in from twenty four hours to have the flange project laterally and posteriorly to four days after the operation. The stenosis was above the opening into the larynx, resting upon the promptly relieved in all. Eight out of the nine were arytenoid cartilages behind, and the aryteno epiglot- able to drink several consecutive swallows immeditidian folds on each side, with the head of the tube ately after the operation, and continued to do so as in such a position that when the epiglottis is closed, long as they could swallow. The eight suffered little it would come in direct contact with the tube, closing or no pain from the presence of the tube, nor was its orifice but allowing its flange to project beneath it. the cough particularly troublesome. Four coughed (Fig. 2) It now became necessary for me to either but very little. In one the presence of the tube in the acknowledge my error and turn the tube around, or larynx did not excite cough; on the contrary, there justify the position and claim an improvement. I ex- was less coughing than before the tube was introamined the five cases and was fully convinced that duced. She died on the into the trachea, I would state that it is certainly a fourth day from pneumonia, the development of remote danger, as any one will admit that attempts which was probably favored by the irritation of the to push the head of a well fitting tube beyond the tube. This was Olga L., a girl 5 years of age, a pa-chink. tient of Dr. Emrick's. About two years previous, she swallowed, by mistake, some concentrated lye, themselves for the better adaptation to this mode of causing extensive destruction of the tissue followed intubation, and which have been constructed for me by a violent inflammation. After a long and desperate struggle she recovered her general health; but there remained two almost impervious strictures of the cesophagus. She had been under my care six months for the surgical treatment of the strictures when she contracted diphtheria, for relief of which the "deep tubing" was practised. It was to these changes in the pharynx and cosophagus caused by the lye that I attributed her intolerance of the laryngeal tube.

In seven cases death was caused by constitutional diphtheria, in one by extension of the exudation below the tube, and in one from pneumonia. While this summary of nine fatal cases of intubation of the larynx for diphtheria would show that intubation does not cure; it does not prove that intubation is an unjustifiable practice. On the contrary, it shows that the practice is one capable in the simplest manner of affording the greatest possible relief and allowing the patient to die a less horrible death than that of suffocation, and at the same time give one more chance for life.

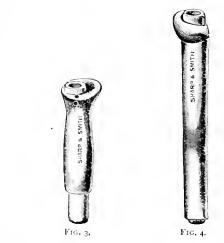

In comparing the two methods of introducing the most objectionable feature of the O'Dwyer method. It is the projection of the head of the tube over the the glottis from folding down and adapting itself to introduction of the extractor. the top of the larynx in the usual manner. This fluids especially, are forced into the larynx, thus and pressed home with the finger before the obcausing the most distressing paroxysms of coughing turator is withdrawn.

DEEP TUBING OF THE LARYNX.

EMMET'S NEW OPERATION FOR PROLAPSE OF THE POSTERIOR VAGINAL WALL,

Or So-called Laceration of the Perineum.

Abstract of a Paper read before the Obstetrical Society of Philadelphia, February 3, 1887,

BY J. M. BALDY, M.D., OF PHILADELPHIA.

Since I have become familiar with the subject it has each day seemed more incomprehensible to me, why the Emmet operation has not come into more general use. I have come to the conclusion that the sink his finger without finding much resistance, and fault lay in defective description of the operation as: set forth in most cases, and in the fondness of men for working on the skin perineum, and not in the op- be necessary to consider the attachments of the peleration per se. The operation, as described by most vic viscera. The only aid this body could give the supposed support O'Dwyer tubes (Fig. 4) when placed deep in the lar- would be by the uterus resting directly upon it. Dr. ynx, will reach to the seventh ring of the trachea, as Emmet puts it very happily when he says "it would shown by an autopsy. This, owing to the mobility of be as rational to assume that a man's pantaloons the lower end of the tube in the trachea in the varying were supported by the legs resting on the instep or positions of the neck, is a source of irritation excit- foot." The principal support of the pelvic organs is ing cough and inducing pain. One of my patients their ligamentous attachments, on the same principle would invariably point to that locality when asked to as the organs contained within the abdominal and thoracic cavities are suspended. A good proof of Finally, I would recommend "deep tubing" of the this is the fact that we constantly see women going about their daily work who have their superficial or skin perinea, not including the fasciae or muscles, torn even to the sphincter ani, and who never have suffered any inconvenience therefrom, and who probably never will. The cause of all the various ailments following parturition, beginning procidentias, etc., will be found inside the vagina on the posterior wall. If any one will place his fingers on the posterior vaginal wall of a woman who has never borne a child, and move them first to one side and then to the other, he will find a firm resistance to pressure in any direction. If he now introduce his finger into the vagina of a woman who has had an injury to the pelvic floor during parturition, he will fail to meet with the resistance which he met in the first He will find instead a rectocele of greater or less extent, with deep divulging sulci running up each side of the recto vaginocele, into which he can easily yet the external or skin perineum may be perfect.

To fully and clearly understand this change it will Dr. Emmet passes superficial ones. In reality, Dr. The transversus perinei, when it exists at all, arises Emmet's "superficial" stitches are only relatively su- from the pubic arch, and its fibres are lost in the posterior wall. My excuse, therefore, for offering a Goodell says that "the property of this muscle is to contribution on such an old subject, is to attempt to pull down the rigid clitoris into contact with the tedious in detail to those who are familiar with the vaginal glands, and to compress the dorsal vein as well as the bulbs of the vagina, so as to obstruct me-The belief that the female perineum, or perineal chanically the current of blood and produce a turhold them in place and give firm support to the dif- the operation) into the crest of the rectocele and ferent venous plexuses; amongst others the vaginal draw it upwards, without undue traction, to the meplexus.

The bowels are kept solu- a large portion of the contents was discharged. Inble from the first; and the urine is passed every four troducing my hand, the tumor was found to be mulor five hours, the patient getting on her hands and tilocular; the additional compartments were torn knees if necessary. There is no necessity for bind-open and emptied. At this stage of the operation I ing the knees together, nor for keeping the woman was first able to appreciate the immense size of the in one position for days. The stitches may be taken cyst and the extent of adhesion. Only three weeks out on the eighth day.

A CASE OF INTRA-LIGAMENTOUS OVARIAN CYST: GENERAL PERITONITIS; UNIVERSAL AD-HESIONS; OVARIOTOMY; RECOVERY.

A Paper read before the Central Kentucky Medical Association.

BY L. S. McMURTRY, A.M., M.D.,

OF DANVILLE, KY.

FORMERLY PROFESSOR OF ANATOMY IN THE KENTUCKY SCHOOL OF MEDICINE, \mathtt{ETC}_{\star}

Society I have described the technique of the operation, and discussed points relating to the diagnosis edge of the incision. I succeeded in getting "a hold" and pathology of ovarian tumors. So much has been in this way, and proceeded cautiously, but as rapidly written of late upon this subject, and such brilliant as I could, in the work of enucleation. I stripped results have been obtained by many operators, that the cyst from the pelvis, the bladder, and the whole an eminent authority suggests the idea that the last surface of the womb, from the ascending, transverse words are said upon the subject. While this degree and descending colon. I then stripped the small of perfection may apply to a few expert operators intestine and omentum from the cyst. I was careful to avoid injury regarded "a closed chapter" by the profession of the to the ureters on each side, an accident not unknown United States, where a large population is scattered in such cases, and, of course, one of the utmost over a vast area and the work necessarily distributed gravity. The lower portion of the cyst I found inamong a large number of operators. Hence I make cluded between the folds of the broad ligament, and no apology for reporting in detail the following diffi- had to be carefully enucleated. The tumor sprang cult and complicated case, illustrating, as it does, from the right side. When all the adhesions were

and blood-vessels, is past. It is as much a relic of so many important points in advanced abdominal

On November 18, 1886, I was called to Williamsing. The material of the suture is immaterial. Cat. burgh, Ky., by Dr. E. S. Moss, of that town, to see gut can be either shotted or tied. As moisture causes. Mrs. G. W., aged 29 years, the mother of six chilthe gut to swell, it should be shotted as soon as dren, the youngest being 3 years of age. The papassed and fastened to the public hair with a pair of tient was confined to her bed, vomiting daily, and hæmostatic forceps. This will keep them out of the suffering severely from the effects of intra abdominal way of the operator. Dr. Emmet always uses silver prepuce. The tumor was first observed two years wire twisted and then shotted so as to be easily ago. Six weeks previous to my visit she was tapped found; the end is bent over and lies tlat on the ris- and a large quantity of fluid drawn off. This was sues. Silkworm gut should always be shotted. It followed by a severe attack of general peritonitis, the makes an excellent suture, and forms a good splint temperature ranging above 105. F., during which her to the tissues. Whatever is used, the stitches are life was almost despaired of by her physician. Three equally hard to find and remove. A very easy method weeks before my visit she was tapped the second for either wire or gut is the use of "Aveling's wire time, and the fluid again rapidly accumulated. A coil." These can be made by wrapping a piece of careful physical examination confirmed the diagnosis

The operation was performed at 11 o'clock on This coil is slipped over the two ends of the suture Thursday, November 18, 1886, the following gentleand secured in its proper place by a compressed shot, men being present: Drs. E. S. Moss, Gatlift, Wat-In removing, snip off the shot, remove the coil, and kins, Parker, Blain, and Ellison. Dr. Gatliff administered ether, and Dr. Moss kindly assisted me The after-treatment is very simple. If the patient throughout the operation. On making the incision having elapsed since the last tapping, and the fluid not having fully refilled the sac at the time I saw the patient, I had failed to realize the immense size of the sac. I now discovered that the tumor extended from Douglas's cul-de sac to the diaphragm, and that the adhesions were absolutely universal.

Being unable to evert the sac, I sought for some unattached point through which I might gain entrance to the peritoneal surface and remove the cyst by enucleation. In this I failed, for the preceding peritonitis had firmly fused the peritoneum and cyst wall, leaving no unattached point. To determine this point thoroughly I enlarged the incision from three to about five inches. Finding it impossible to gain In previous reports of cases of ovariotomy to this an entrance by an unattached point, I began the dissection of the cyst with scalpel and forceps at the

Through the lower angle of the wound operation, the temperature again ascended, reaching bandage applied. entire operation occupied fifty-eight minutes.

which had been carefully cleansed, dried and pre-prompt recovery: pared for the purpose. The bed, mattrass and clothing were new, and everything used was scrupulously case from the day you left, and hope you will place them in such clean. I will not describe the details of preparation form as you think best. I ceased to visit her regularly on January and the best of the season of of t of sponges, instruments and dressings, as it would be a mere repetition of previous reports made by me to this Society. I will only say that I continue usual standard of strength and flesh, and is daily attending to to use a solution of carbolic acid, strength of 1 to her household duties. Very respectfully, E. S. Moss. 40, for the instruments and sponges, and for sutures and ligatures the best silk; and that I spare no pains in my endeavor to secure perfect cleanliness of operator, assistants, and everything coming in contact with the patient. I believe that the faithful application of the principles of the Listerian system is the only sure Read before the Denver Medical Association, February 8, 1887. method of attaining good results after laparotomy. As to whether asepsis is attained by carbolic acid, corrosive sublimate, iodoform, hot water, or other agents, is unimportant; the principles of Listerism are essential, though the manner of their application for an opportunity to use my set of O'Dwyer's inmay vary with the fancy of various operators.

The attending physician in this case was Dr. E. S. Moss, of Williamsburgh, an accomplished young practitioner, formerly an *interne* in the Louisville City Hospital. He assumed the management of the case the second day after the operation, and conducted the after-treatment. We were in daily communication by letter and telegraph. From his notes kindly sent me, I condense the following history of fellow, apparently in the best of health except for the progress of the case after the operation:

The shock of the operation was severe, and reaction came about rather slowly. During the first three days all went smoothly, the temperature and pulse ranging about 100. The catheter was required to relieve the bladder. On the third day, the discharge from the drainage tube having about ceased, the tube was removed and the edges of the wound brought firmly together. On this day, also, there being some distension, an enema of warm water was administered, which brought away freces and gas.

On the fifth day the pulse was over 120, and the

separated the tumor came away without a pedicle, temperature reached 104° F., with general symptoms The left overy was found to be normal, and hence corresponding. Being apprised of the situation, I was not removed.

Being apprised of the situation, I telegraphed Dr. Moss to open the wound, wash out The toilette of the peritoneum was tedious and the peritoneal cavity, and retain the drainage-tube in exacting; many bleeding points had been secured place, which was promptly done. I also suggested with forceps and many were ligatured. After secur- the administration of a brisk cathartic, and Dr. Moss ing all bleeding points, the abdomen was washed out gave a dose of calomel and jalap, which acted freely with pure warm water, and I began the introduction and promptly. Our efforts were rewarded by the of the parietal sutures. At this stage of the operatemperature falling below 100° F., with correspondtion the patient's pulse became very rapid and feeble, ing improvement in all the symptoms. The patient and, assisted by the gentlemen already named, I continued to progress satisfactorily for a number of

On December 10, the twenty-second day after the I then passed a Keith's glass drainage-tube, and tied 1104° F., with rapid pulse and very alarming sympthe stitches closing the incision. The surface of the toms. Dr. Moss again opened the lower angle of abdomen being thoroughly cleansed and dried, the the wound, introduced a rubber drainage-tube, and wound was dressed with antiseptic gauze, and a washed out the peritoneal cavity. The improvement The drainage-tube was secured was prompt, but the discharge persisted until Decemin place in the usual way, and its external opening ber 19, when, having altogether ceased, the tube was protected with sponge and rubber sheeting. The removed and the wound allowed to close. On December 26 the patient sat up, and she improved rap-The patient occupied a room to which she had idly from that time on. The following letter from been removed from her home in the country, and Dr. Moss, dated February 1, 1887, announces her

> Dear Dector: - Enclosed I send you notes of Mrs. W.'s ary 9, as she was then going about the house. She has completely recovered and has returned to her home, six miles in the country. Her husband informs me that she has reached her

MY FIRST INTUBATION OF THE LARYNX; RECOVERY.

BY CHARLES DENISON, M.D.,

OF DENVER, COL.

For several months I have been on the outlook tubation tubes. The first opportunity, that of diphtheritic laryngitis at the Orphans' Home, was lost through the negligence to call me in time. The little patient's heart was ceasing to beat as I reached the Orphans' Home.

On February 1, at 11 A.M., I was called in haste to see a 6 year old boy at 1016 Thirteenth St., the adopted son of J. H. T. He was a rosy-cheeked the dyspacea, etc., which characterized his condition at that time. His respirations were labored, decidedly *croupy*, his face suffused, and there was aphonia. His temperature, in the groin, was normal, pulse 120, and respirations 35 per minute. On examining the throat a patch of false membrane was detected to the right of the epiglottis and just below the tonsil. Here was a case of true croup, or pseudo membranous laryngitis, that dreaded condition which, if your experience has tallied with my own, you have almost always seen end in suffocation and death.

As to the cause of this attack, it should be re-

tive effect, due to this fever, it is interesting to note that of eighty-seven cases of diphtheritic laryngitis the cadaver or a healthy person. reported in the autopsy records of the New York number, had followed immediately after measles.

ous night, had had syr. of ipecae and some relaxing cough mixture, like hives syrup, which had produced emesis, and thus relieved several hard attacks of dyspnea. I prescribed wine of ipecac, a teaspoon- able. The boy began to breathe freely at once; his ful every ten minutes during the bad spells, the throat eye brightened; the leaden color left his face to be and chest to be rubbed with a relaxing embrocation, displaced by the natural hue, and within ten minutes and covered with a poultice, which was held in place he drank two cups of milk, when for six or eight the following:

B. Sodii benzoati, \$58. Acidi carbolici cryst, gr. v. Glycerm,

Sig. Use on swab every four hours and give half a teaspoonful between times.

The attendants were informed of my movements, so that I could be found in case urgent symptoms should supervene.

At 2 P.M. the treatment seemed to have done very The child had vomited once or twice, the dyspacea was not so distressing, though the respirations were 38 to 40 a minute. The use of the swab the larynx, a fact which made me hopeful the remainder might be dislodged.

At 4 P.M. the dyspncea was increasing; respiration slowly disappearing. 44, pulse 120 or over, and temperature normal.

to have to operate at any time. Some temporary relief was afforded by the inhalation of steam from slacking lime, but the symptoms from hour to hour ventor of these tubes, praise equal to that given to were getting worse.

longer delay. Temperature rising, pulse 130 to 140, and respirations 50 per minute. Respirations super- emy of Medicine, lately summed up the advantages ficial, labored, and accompanied with retraction of and disadvantages due to intubation as follows: the abdomen; lips turning purple and face suffused, and with skin of that fatal leaden hue. The eyelids would remain partly open as the child temporarily and friends. slept. Expectoration and cough had ceased for some time, and the breathing was loud and whistling. I from danger and free from shock. am convinced that there would have been no further expectoration to relieve the then present suffocation. ants. It was very soon after to o'clock when I had the boy held in the sitting posture on the knees of A. M. of the case requires no trained attendant. The in-Mortimore, and while the head was steadied by Miss Launey, one of our medical students, I introduced the gag (which comes with the tube to hold the jaws found useful as a guide upon which to cut. apart) and, having already prepared the proper-sized tube for a 6 year old child, quickly, and as gently as all: it embarrasses and sometimes interferes with the possible, considering the struggling of the patient, swallowing of fluids." introduced it so that the head of the tube was down in place below the rim of the epiglottis. This intro- halations, etc., had softened the membrane and thus duction was accomplished with the right hand, while prepared the way for its expulsion, we cannot, of

The relief, however, was instantaneous and remarkwith a snugly fitting cotton jacket. I also ordered hours before he had taken only a swallow of liquid at a time.

I expected that the membrane would reform, and that I would be called within three to five hours, as others have reported they had been, to reintroduce the tube. But in this expectation I was happily disappointed, for I not only enjoyed a good night's rest myself, but so did my little patient. I found him bright and smiling in the morning; respiration somewhat croupy, cough loose, aphonia continued, pulse 92, respirations 34, and temperature 99.5° F. The previous day's plan of medication was in the main continued.

About 3 P.M. I was summoned in haste, but a severe attack of dyspncea had been relieved, when I arrived, by expectoration. Pulse then 112, respirahad wholly removed the false membrane from above tion 36, and temperature 101.5°. After that there was continued improvement, and to day the boy is hearty and well, except for a partial aphonia which is

Of course, taking this single case as the basis of After 7 P.M. I remained with the patient, expecting my conclusion, and notwithstanding the unusual though favorable termination of the first attempt, I feel like ascribing to Dr. Joseph O'Dwyer, the inany of the many illustrious men who have contributed By 10 P.M. When there use of papayotin in fissures of the tongue, after is a soft artery with a weak pulse, subnormal doses chromic acid, iodoform and nitrate of silver had only should be given—a quarter to half a drop, failed. The papayotin was administered in the After the trial dose is given, the patient's sensations following form: of pulsation and pain in the head, as well as the distension of the radial artery under the finger of the physician, will be the guides for increasing the dose. The author finds that the best modes of administering nitro-glycerine are the simple dropping of the solution on the tongue, and by means of tablets; much less satisfactory results were obtained when given mixed with water.—Lancet, Feb. 19, 1887.

lodoform Injections in Cold Abscesses.— Within a few years a new method of treatment of cold abscesses has been largely adopted, which is simple, easy of performance, and apparently devoid of risk to the patient. We refer to the use of iodoform injections. It consists simply in the evacuation of the abscess by means of an aspirator, the largest-sized needle being used, and in the subsequent injection of a solution of iodoform in ether. A 4 or 5 per cent, solution is the one more commonly used for abscesses of large or moderate size, but occasionally the strength is increased to 10 per cent, when the abscess is of very small dimensions. The quantity of solution to be injected varies according to the circumstances of the case, though, in view of the danger of exciting toxic symptoms, it is generally recommended that not more than a drachm of iodoform should be used. The ether holding the iodoform in solution finds its way into every pocket and sinuosity of the abscess cavity, and there deposits a film of iodoform. Some little attention is necessary after the injection has been made, as the ether is volatilized by the heat of the body, and may cause an unpleasant degree of distention of the abscess cavity. If this occur it may be necessary to introduce the needle of a hypodermatic syringe in order to give exit to the gas. Ordinarily, however, the pa tients suffer little inconvenience, and are able to go about as usual after the operation. The experience of those who have employed this mode of treatment has been that one injection is often sufficient to effect a definite cure of the abscess, provided, of course, that it is not directly connected with a centre of disease in a bone or joint which is constantly secreting pus. Sometimes, however, it is necessary to repeat the operation two or more times. The chief inconvenience of this method is the pain which it causes. This is usually pretty severe, and is sometimes so

as a rule, that the condition of the pulse is the best great that the patients prefer to renounce all treat-

It is not in the treatment of cold abscesses alone

Papayotin in Fissures of the Tongue.—Pro-

R. Papayotin..... 1 to 2 parts. Distilled water.

This solution is to be applied with a camel's-hair brush, from two to six times a day, the tongue having been previously well dried. There is no maceration, as would be supposed, but the mixture stops the pain and seems to cause a renewal of the epithelium. Schwimmer reports twenty-five cases, some of several years' duration; and complete cure was affected in all except one, which was syphilitic, though specific treatment gave us no good result. But in this case papayotin ameliorated the condition of the tongue.— Wiener med. Wochenschrift.

Antiseptic Collodion.—The Journal de Médecine of December 26 contains an account of a new kind of "collodion," which is antiseptic and promotes cicatrization. It does not cause inflammation, and may be substituted for collodion made from gun cotton, in the treatment of wounds and bruises. Like traumaticine, it is efficacious in relieving neuralgic pains, and acute or chronic rheumatism. The affected parts should be sponged with it every twenty-four hours, and in serious cases every six hours. If strips of linen or silk be soaked in this collodion, an excellent sticking plaster is obtained, which quite equals English court plaster. The following is the formula: Mastic in globules, 3 grammes; balsam of Peru, 1 gramme; narcotine, 1 gramme. Each ingredient should be ground separately, and 5 grammes of chloroform added thereto.

Treatment of Sciatica.—Dr. Metcalf, of New York, says that no prescription for sciatica has ever equalled in efficacy the following: R. Tinct. aconit. rad., tinet. colchic. sem., tinct. belladonna, aā 3 j. m. Sig.: Dosc, six drops every six hours. He also uses triturate tablets, each containing three drops of the following: Tincture of aconite root, tincture of seeds of colchicum, tincture of belladonna, tincture of actea racemosa—equal parts by volume. Dose, one every four or eight hours.

VERSE FRACTURE OF THE PATELLA.

of late in the treatment of transverse fractures of the supplying the patella, from which it may be seen pathology of these fractures, and consequently there atous hamorrhage from the cancellous tissue in the Lancet, of November 17, 1883.

examined ten fresh patellæ from as many different these might prevent union were no attempts made to subjects, the ages varying from 2 to more than 60 bring the fragments together. But we know that tella were presented by a very thin film, in many is easily overcome, and with ordinary care could not

tinuous from the tendon to the ligament, a few being oblique. The intra vitam examination of these structures in recently produced transverse fractures coincided with these anatomical investigations; and in applying these facts it should be remembered that the time at which this fracture is most likely to occur coincides with that in which the aponeurotic structures are most developed in front of the patella.

The three causes which have been assigned for the want of osseous union after transverse fracture of the patella are: t. A supposed deficiency in the patellar blood supply, causing a low vitality of the part and thereby preventing an outpouring of sufficient ossific deposit to unite the fragments together. 2. The separation of the fragments, by the retraction of the quadriceps extensor carrying the proximal portion of the patella upwards and away from the lower fragment. 3. The distension of the joint by blood and serum, thus preventing approximation of THE PATHOLOGY AND TREATMENT OF TRANS, the fragments. As regards the deficient bloodsupply, the facts are entirely against such assump-While advance in some quarters has been made tion, as shown by injected specimens of the vessels patella, there has been but very little study of the that the blood-supply is abundant; by the parenchymis considerable diversity as to treatment; the greater transverse fracture of the bone; and by the fact that number of surgeons, holding the current views as to osseous union is constantly obtained in longitudinal the cause of non-osseous union, adhere to the older fractures, and that ossific deposition is so abundant methods of treatment. And as these entirely to nature, which alone, sooner or later, by several State officers are not presumed to know much

ecaries, the Board is required to select five skilful apothecaries of not less than seven years' experience, who shall assist the Board in conducting the necessary examinations of applicants for licenses, etc. This mode of constituting the "Nebraska State Board of Pharmacy" reminds us of the first law for regulating the practice of medicine in the Colony The President. Thomas M. Drysdale, M.D., in of New York in 1760, which read as follows: "No person whatsoever shall practice as physician or surgeon, in the City of New York, before he shall have EMMET'S NEW OPERATION FOR PROLAPSE OF THE POSbeen examined in physic and surgery, and approved of and admitted by one of His Majesty's Council, the Judges of the Supreme Court, the King's Attorney General, and the Mayor of the City of New securing of sutures at the moment of insertion. The York for the time being, or by any three or more of them, taking to their assistance for such examination, such proper person or persons as they in their discretion shall see fit." Notwithstanding this ancient and honorable precedent, the question will recur to most minds, why not make the five "skilful retail apothecaries of seven years' practical experience" ing sutures so as to avoid imbedding the free ends of the State Board, instead of simply assistants?

The general provisions of the law appear to be judicious and practical, and if executed with fidelity, will do much to secure for the people of that young perineal restoration. The inside method of Emmet and vigorous State the services of educated and skil- gives the best result. The use of well prepared catand vigorous State the services of educated and skilful apothecaries.

THE MEDICAL REGISTER is a new weekly journal of medicine and surgery, published by the Medical Register Company, 1519 Walnut Street, Philadelphia, and edited by John V. Shoemaker, A.M., M.D., and William C. Wile, M.D., both well known to the readers of medical journals in this country. The Medical Register contains twenty-four double column pages of reading-matter, and has reached its seventh issue, furnishing abundant proof of enterprise and editorial ability.

IMPORTANT NEW WORK.—We learn that the first volume of "The American System of Gynecology," recently announced by Messrs. Lea Brothers & Co., of Philadelphia, is well through the press, and will soon be ready for delivery. The contributors to this work embrace a large number of the eminent gyne-, cologists in this country.

Effect of Micturition on Pulse-rate.—Dr. sometimes raise the temperature above normal.

SOCIETY PROCEEDINGS.

OBSTETRICAL SOCIETY OF PHILADELPHIA.

Stated Meeting, Thursday, February 3, 1887. THE CHAIR.

Dr. J. M. Baldy read a paper on

TERIOR VAGINAL WALL, OR SO-CALLED LACERA-TION OF THE PERINEUM.

(See page 339.)

Dr. M. Price described a plan for the temporary ends being left long, two perforated shot are slipped on; the first one is to be the permanent fastening and is left loose, the second is compressed to secure the suture ends together and to prevent the other from slipping off until the time for final closing, when the first is pushed down and compressed.

Dr. Joseph Price described several ways of secursilver ones and to secure easy extraction. Over the silver wire pass the Aveling coil and shot; this will greatly facilitate its removal. He also made some critical remarks on different methods of operating for gut for the sulci sutures materially facilitates the operation. Set the sutures fresh from the alcohol and drop a shot over before they swell.

Dr. Chas. Meigs Wilson stated that the difficulty of representing Emmet's operation diagramatically is due to the fact that the plane of the posterior wall of the vagina is altered by the traction upon the tenaculum holding the crest of the rectocele. The needle figured upon the blackboard by Dr. Packard was not a Baker-Brown needle, as stated by Dr. Packard, but a modified staphylorrhaphy needle, the needle arm being longer, thinner, and having a greater are of curvature than the ordinary staphylorrhaphy needle. It was first devised by Dr. E. Wilson, to use in uniting the freshened surfaces in Emmet's operation upon the cervix. The objection to its use in colporraphy operations is that, owing to the shortness of the needle arm, the shoulder of the needle, i. e., the junction of the needle arm with the handle, made such a large opening in the mucous membrane of the vagina that the stitch was liable to tear out, especially if there was much tension before union had taken place.

Dr. Longaker spoke of the advisability of the primary operation. He believes all forceps with long blades and large heels will do damage to the vaginal outlet. He has seen transverse tears of the outlet Isaac N. Himes, of Cleveland, writes us, in regard after natural as well as instrumental labor. It has to examination for life insurance, that the pulse rate been remarked that perineal ruptures may exist withgenerally falls after micturition, if the bladder be out causing any symptoms, but this is no reason why completely emptied; the pulse often falling from 80 tears in general should not be repaired. He beto 76 or 74. He thinks that retention of urine may lieves in performing the primary operation in every case. He likes the Chinese silk for sutures. He

has examined a perineum immediately after labor and found it apparently intact, and a month later cous tear.

Dr. Joseph Price, upon request of the President, remarked that he had seen Mr. Tait operate for a complete tear into the rectum, also for partial laceration and rectocele. He operates so rapidly that it is difficult to follow him. He makes two scissors cuts, one on each side of the laceration, splitting the tissues from the centre line laterally and forward. He removes no tissue, but throws one flap inside and the other out, and closes by interrupted buried sutures of silkworm-gut. In the complete rent, he splits the septum laterally, turning one flap into the bowel, the other into the vagina, and closes by interrupted transverse buried sutures, with two or more external sutures.

Dr. H. A. Kelly stated that this operation was not original with Mr. Tait. It had been originally devised by A. R. Simpson, of Edinburgh, and a description, with illustration, is to be found in Hart and Barbour's Manual.

Dr. Baldy, in closing the discussion, stated that the needle used by Dr. Emmet was round, slightly has now in his care a patient whose fourchette is perfect, but scar tissue can be felt inside of the perineum, and there is some little prolapse of the posterior wall. When she was delivered, some weeks ago, the need of an operation became apparent, as at that time the anterior wall and bladder prolapsed before the head in a mass as large as a base ball. He does not sym pathize with the total condemnation of the forceps; they are needed sometimes, though frequently abused; neither does he approve of the so called support of the perineum either by towel or hand, nor the idea of holding the head back, because these methods deflect the force of the uterine contractions against the posterior vaginal wall and the pelvic floor. He has seen by eminent gynecologists, in which the result was a perfect external perineum, but in which the pelvic ation. The floor was completely restored by the Emmet method subsequently.

Dr. Jos. Price read an extract from a private letter from Dr. Emmet to himself: "I am very glad that the woman who was operated on has fallen into your hands, so that you may be able to make a report of the exact condition after labor. I have not kept any accurate account, but I think I have heard of some twenty cases who have gone through labor outlet had been done. On the other hand, I have after the operation, which is of more value, for I' than of the success."

Dr. Jas. V. Kelly reported a case of

PLACENTA PRÆVIA.

K. W., fifth pregnancy, had a vaginal hemorrhage found a rectocele and cystocele, indicating a submu- December 28, 1886. The bleeding was quite profuse, but ceased spontaneously. On examination, the os admitted with ease the index finger, which came directly in contact with the placenta. The patient was supposed to be nearing the completion of the eighth month of pregnancy. She was enjoined to rest in bed and dilute sulphuric acid was administered. Several days later the hæmorrhage recurred, and again ceased spontaneously. She kept on dribbling a little each day until January 11, 1887, when she had a violent hæmorrhage, and I determined on active interference. Her pulse was 120; she was very pale and had attacks of fainting. os was dilated to the size of a half dollar, and dilatable. I gave her 15 drops of Squibb's fld. ext. ergot. There was no decided pain, though the patient said she felt some slight bearing down. I brought her to the edge of the bed, with her knees flexed, and found a decided thinning of the placenta toward the right sacro iliac symphysis. It was difficult to rupture the membranes without detaching the placenta, so I made firm pressure over the fundus, which caused the head to descend, and I then ruptured the memcurved at the point, and from three-fourths to one branes against the vertex. The waters drained off, inch in length. He uses it with a needle holder, and, the uterns condensed, and the bleeding ceased. I as a rule, prefers to have it threaded with a silk loop then gave 20 drops more of the ergot, and slight into which the wire sutures are hooked. Dr Baldy pains were noticed shortly afterwards. I still kept my index and middle fingers in the rent I had made in the membranes and the edge of the placenta, endeavoring to prevent any bleeding by pressing the placenta against the left side of the os. The pains became stronger and the head descended and the bleeding again returned. I endeavored to accelerate the labor by encouraging the woman to bear down and by making strong pressure over the fundus, but as these measures did not produce the desired result as rapidly as I wished, and the head having passed the superior strait, I applied the forceps and delivered. There was no further hæmorrhage, and the placenta was expressed by Créde's method in fifteen minutes. The woman received a vaginal injection of cases which had been operated on by the old method, warm vinegar, as well for its antiseptic as for its hæmostatic properties.

The fœtus was of fair size for the eighth month, floor was as badly off as it had been before the oper- and was nearly lifeless. Artificial respiration, mouth to month, revived it and it lived thirty hours. The mother was in a very exhausted condition, and was given brandy and ammonia for nearly a week. The pulse after delivery was 140. She was also given plenty of milk and broth, and not allowed to raise her head off the pillow for a week. She has since entirely recovered. No tampon was used in this case. Ether was not administered.

Dr. M. Price had recently attended four cases of without accident after the operation at the vaginal placenta prævia at full term; one, a very desperate one, had been tamponed. The cervix was dilated not heard of a single case where the parts were torn to the size of a half-dollar. He was urged by his consultant to introduce his hand, turn and deliver, should be more likely to hear promptly of the failure which was, much to his surprise, accomplished in ten minutes, with child and mother both saved. The four children were all saved, and the mothers also, although one of the latter died from anæmic causes

three months later. He would at once, when called cases. Where the pains are strong and the hæmorto such a case at full term, or in premature ones if thage has been but moderate, let the head engage, he considered it advisable, dilate, turn and deliver, and more children will be saved. The method adopted in these four cases is that now adopted by the best authorities. The child was lost, as the entire placenta tractions, often prevent the finger in the vagina from and retraction of the nterus interfered with utero ined in the morning, the short vagina prevented the placental circulation. In a second case turning was vaginal finger reaching the promontory while the outfollowed by similar results in a case of placenta præside hand rested upon it, and on pressing deeper felt via centralis. While the two children were lost, the vaginal fingers fully 3 centimetres below. This both mothers recovered without an unfavorable symp-case was measured by the outside hand and detertom. In three cases respectively of lateral, marginal mined normal. Another case had a rachitic pelvis, and partial placenta prævia, treated by rupture of 8½ cm. conjugate. She had borne ten children at them, two children were lost. In one of these cases the mother's life, would it not be best to interfere invaluable facts in other cases. promptly when called to a case of hæmorrhage from this cause, regardless of the age of the feetus?

Dr. H. A. Kelly exhibited a

PLACENTA PR. EVIA CENTRALIS OF THE SEVENTH MONTH,

in which he had perforated the placenta to break the amnion and, after turning, delivered, saving the mother, who had suffered from profuse hæmorrhage. He described a case in which turning proved impossible in a placenta prævia lateralis, owing to the fact that the cord was so tightly wrapped around the child's neck that only a small bight was left between the head and placenta, and when the foot was brought out at the vulva the head was felt fixed at the brim as at first. The foot was returned, and a forceps delivery of the head revealed the difficulty, which was corwith it. Turning is only needed in the more urgent excepting two, it was done early, five recovered.

(For Dr. Kelly's and Dr. Parvin's remarks on the

Dr. Price's cases were at full term. He had not DR. LONGAKER thought it far better to turn the taken premature cases into his account. Deliveries

The short vagina, or cellulitis or cicatricial conwas attached low down, placenta prævia centralis, reaching the promontory. In a case he had exammembranes, and application of forceps in one of term through difficult labors, but without assistance.

The method is simple, avoids a vaginal examinathe feetal heart sounds were extinct on my arrival, tion in the virgin, is invaluable in many cases retrohalf an hour after a sudden and profuse hæmorrhage, spectively and prognostically. The inaccuracy of All the mothers did well. The high feetal mortality the external conjugate is well known. This, of shows that we cannot place much value upon the course, is of no use in the most important class of child's life, and in view of the dangers which threaten cases, the advanced pregnant, but it does often afford

> The method is to press deeply with the finger tips of the extended hand until the promontory of the sacrum is felt, then, by slipping the fingers up and down over this until the relations are well appreciated, let the fingers rest vertically above the angle, and at the same time mark on the palm with the finger of the other hand the position of the posterior surface of the symphysis, also vertically below. This measurement from the mark thus made to the tip of the finger is the conjugata vera thus directly measured.

Dr. Montgomery, in a paper entitled

TRACHEOTOMY AND INTUBATION IN DIPHTHERIA,

urged the importance of early operation. The symptom which should indicate the necessity for operation was depression of the substernal region during inspiration. This symptom indicates the inefficient rected, and the mother delivered of a seven months entrance of air to fill the lungs, and the diaphragm baby, which died immediately. The mother made a becomes a fixed point depressing the soft tissues. perfect recovery. No one rule suits all cases. The The longer this condition continues the greater the first point of importance in event of free hamorrhage danger of collapse of portions of lung tissue. The is to rupture the membranes, and this must not be a large mortality after tracheotomy and intubation is mere puncture, but as free a separation as possible due to the postponement of operative interference in along the placental margin. The hamorrhage comes the majority of cases until these changes have ocfrom the separation of the uterine and placental sur-curred. This assertion is verified by his own experifaces, and this is only to be prevented by freeing the ence in tracheotomy. In his first ten cases, in all but placenta on one margin, so that as the contraction one of which the operation was done as a last resort, goes up the placenta may, as far as possible, ascend none recovered. In the next seven cases, in which,

The two fatal cases were not considered hopeful at the next morning and found the exudation had been the time of operation. His eighteenth case died discharged (a cast of the trachea and bronchi). before the trachea was opened. Of the last ten, five recovered. Twenty-eight cases with ten recoveries, our patients die before this exudation is thrown off. He has practised intubation in thirteen cases with six | Eight years ago 1 had a case of the kind in a man 39 recoveries. All but one of these cases were seen in years of age. He was a miner from the northern consultation, and some of them were in a dying con-part of the State. He had had measles six months dition when intubation was practised. In no case prior to the time I saw him. While at the hospital did death occur in less than twenty-four hours, and he threw off the exudation, with the bifurcation of in all the relief from the dyspnea was prompt and the bronchi well marked. Dr. H. H. Mudd: The experience of the procroup from those of diphtheria. The paper properly tracheotomy may not be performed. dwells upon nutrition and stimulation as the importfourteen recoveries. I have had seventy four operations for diphtheria, with twenty-eight recoveries, tive agents, coupled with stimulative agents. From all cases, without making a distinction between. croup and diphtheria, the work of our office, viz., Dr. John T. Hodgen and myself, together with Dr. Harvey Mudd and Dr. Harry Hodgen, there is a total of 172 cases with forty-four recoveries, a per cent. of 2523. Since June I have had twenty-five cases and twelve recoveries. There was no difference in the class of cases.

We should always give patients the benefit of this operation before it is too late, before the residual air becomes so much that the tidal wave is almost.

I have been interested in the accounts of intubation. I obtained the instruments for it, not that I had any great faith in it, but I knew I should meet many cases where the relatives would not let me make a tracheotomy. 1 say to the parents in these cases, that I believe tracheotomy to be the best operation. I have tried intubations in six cases. In three of these I resorted to tracheotomy afterwards. In one case the trachea filled with a large, hard cast that extended down to the second and third bifurcations of the bronchi, and came near suffocating the child. I removed the tube and performed tracheot- ered almost continuously, with omy. In another case in which I resorted to trache otomy, I at first used a tube of the required size; from August, 1885, to November, 1886. During this this was coughed up within twenty four hours. It time he was occasionally jaundiced; the attacks beused a larger tube and it was coughed up. This was came gradually more severe until he was totally un-

now rely on a prescription that I found in the Lon-condition. The case made a good recovery after tracheotomy. In the third case the child wore the tube four days, during which time he could not swallow without violent coughing; he was very weak, although he had been well fed per rectum. A profuse discharge from the trachea, and râles in the trachea and large bronchi induced me to remove it. The breathing was comparatively easy. But at the end fession in the past few years tends towards the belief of sixteen hours they sent for another surgeon, who that it is impossible to separate croup and diphthet thought there was nothing to be done. I thought so ria. I noticed a short time ago reports of eighty- too, except to make the tracheotomy. This was seven eases of diphtheria in which tracheotomy had done, and the child is getting well. In the other been performed, where it was laryngeal and invisible three cases the patients died. I do not believe that from the beginning in fifty-six cases. I believe you the intubation tube answers the indications as well cannot always separate the cases of membranous as the tracheal tube. Its usefulness is in cases where

DR. I. N. Love: I concur with those who depreant points of treatment. As to the administration of cate causties when they interfere with the proper some salt of mercury and the benzoate of soda, I be tranquility of the patient. At the Copenhagen Inlieve from observations during the past six months ternational Medical Congress some one reported 100 where many have been using these remedies, that cases of diphtheria treated successfully by simple there is benefit in this treatment. A SPECIMEN OF ENLARGED KIDNEY,

taken from a patient, the notes of whose case are as follows:

Frank Schultz, æt. 19, single, peddler. About three weeks ago patient began to grow weak, four days later had hæmaturia, and coughed up blood at same time. The latter has continued at intervals up to present time. Bowels constipated. After entrance to hospital, respirations were slow and quiet; blood flowed from mouth frequently, origin not known. Hæmie murmurs were heard over pulmonary artery, aortic orifice, and at apex of heart. Few sibilant râles in lung. Abdomen tender. Patient had been on a prolonged spree up to three weeks ago. On autopsy, marked congestion of all the abdominal and thoracie viscera was found. The kidneys were enlarged as you see in this specimen. His death could only be accounted for by the general congestion of the above mentioned organs, following the prolonged spree.

Dr. T. F. Prewirr presented a patient who suff-

ble by any means which we possess.

most usually diphtheritic, he is willing to concede.

theritic room into the alley; these were afterward management of diphtheritic cases, it is in not enforccarried by a boy from the second house, and he had ing in the night adequate sleep, and that by chloral. the first case of diphtheria in that house.

Dr. W. Porter said: I have tried to make a calomel freely, but his patients died. practical summary of the prevailing opinion amongst the profession as follows:

2. That diphtheria is not an incurable disease. who have reported practical results favor medications this year or the last of last year. that limit the progress of the poison, that render it have found good effect from using guardedly, bichlor ide of mercury.

to to keep up vitality.

4. The air passages should be kept as free as posbe made. I don't believe that intubation is likely to afford the great relief that its inventor now maintains. When tracheotomy is performed, the child gets air into the lungs pure and fresh; when intubation is nosis (and prognosis) of cases, I have noticed that matter into the lung, to set up pneumonia, from which erally a mild one; if a little further back it was intion; where it is done in cases not associated with fauces, then it was a grave case. this disease, it is not a dangerous operation. I don't believe in tracheotomy when the membrane has descended into the trachea, or when the child is beyond recovery. But where you find that the lungs are resonant, that there is nothing but mucous rales in the bronchial tubes, where the lower air passages are comparatively free, and the upper ones occluded, we

DR. C. H. Hugmes said, that our fathers built Dr. Johnston did not mean by membranous croup, more wisely than they knew, when, failing to draw laryngitis, tonsillitis, pharyngitis, etc. He meant the later scientific distinctions between diphtheria true membranous croup, and believes it is not cura and croup, they treated them as the same thing, and used calomel so effectually. Before Bretonneau drew Dr. G. Hurr said he had been in the habit of the line of demarcation between them, we heard very recognizing three kinds of croup: Spasmodic croup, little of the fatality of diphtheria; and so far as we and a croup due to a simple inflammatory condition can discern from the literature, diphtheria is not a without membrane. That the membranous croup is disease which has come of late. Now the same treatment is given since we have returned to the Dr. W. H. Ford said: A year ago a severe case practical practice of our fathers, and suspended the of diphtheria in an adult occurred in the West End. scientific difference between tweedledum and twee-It was attended by Dr. H. Tuholske. There were dledee. A point which I have not heard discussed, two other cases, all of which recovered. In the is the absolute necessity in diphtheria, as well as in house across the alley from the one in which these croup and every other affection which is taxing cases occurred three other cases occurred in succession the vital powers of the organism, of sustainsion, all getting well. I afterward learned that in ing the vital centres by adequate and enforced sleep cleaning up after the first cases the people of that as well as nutrition. If there is anything in which it house through some of the materials from the diph appears to me that practitioners are derelict in the

Dr. R. Funkhouser had been accustomed to treating many cases of diseases of the throat, but 1. That the profession is not studying so much the during the later part of last year, and early part of obscure points in the nature of diphtheria, as it is the this year, he had not had a case of diphtheria. He practical benefit to be derived from properly treat- considers that a great many cases reported are not diphtheria.

In reply to a question by Dr. Rumbold, Dr. Funk-Those who have had the best results favor first limit-houser said: Some cases I have had have been in ing the local progress of the disease. It is not fair the neighborhood of cases reported as diphtheria; to say that because the cauterizing the throat has their parents were much exercised and sent to me, failed to cure cases, therefore local applications to expecting me to pronounce them diphtheria. It may the pharynx made with gentleness and tact, cannot be that some of my cases might have been called be made so that the child will not resist. Also, those diphtheria, but I have not seen a case of diphtheria

Dr. Love said, that this point was touched upon inert. The use of the benzoate of soda has in in his paper; it was suggested, that some observers creased in favor and my experience with it corrobor- might be more liberal than others in their interpreates the good reports concerning it. I am sure I tation of the symptoms. But we do not want to go too far in either direction. The death rate is enough to indicate that diphtheria has been abroad in the 3. Nutrition and stimulation should be resorted city. We all know a classical case of diphtheria, but we may have mild cases, severe types and malignant types. During the time that diphtheria prevails, sible, and, if necessary, an artificial opening should there is always an epidemic of sore throat. The symptoms of a case of diphtheria may vary to such a degree as to make the diagnosis doubtful.

DR. RUMBOLD said: In reference to the diagperformed, the child continues to breathe through the when the membrane is located on the tonsil, or in diseased channel; is liable to receive particles of the anterior portion of the throat, the case was genit dies. Tracheotomy is not such a terrible opera creased in gravity; if in the posterior portion of the

CHICAGO MEDICAL SOCIETY.

Stated Meeting, March 7, 1887.

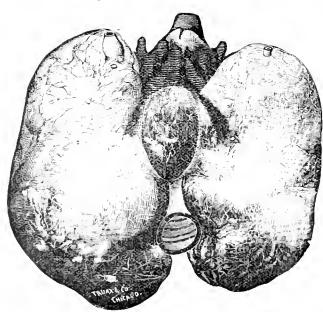

The President, Edmund J. Doering, M.D., IN THE CHAIR.

Dr. A. E. Hoadley read a paper on

DEEP TUBING OF THE LARYNX AS A SUBSTITUTE FOR INTUBATION, WITH A REPORT OF NINE CASES.

(See page 337.)

Dr. F. E. Waxham opened the discussion and said: In this connection I take occasion to present a bronchocele which produced death by pressure on the trachea. The history of this case, briefly, is this: The patient was a girl 14 years old; she had been troubled with a goitre for about a year, which increased rapidly in size and the people observed that it was at times larger than at others, more particu- agus and the trachea and produce pressure postelarly after the child had taken cold; but still the goi- riorly. In this case the pressure was exerted latertre gave no inconvenience until three days before ally. Coming more particularly to the discussion of death, when it is stated the child had taken a slight the paper presented to night, I feel that it should not cold and the tumor became larger. With increase go without a few words of criticism. As I believe in the size of the tumor and the consequent pressure that an old adage is that the proof of the pudding is upon the gland by the sterno-thyroid muscles, great in the eating of it, and as intubation has been perdyspnea resulted. The patient was attended by Dr. formed nine times without a success by this new pro-J. G. Berry, who recognized the true condition, and cedure, I would feel that there is little to recommend on the third day I was called to perform intubation. it. First, in regard to the position of the tube; the The child was now in the most desperate condition; author recommends that the tube be reversed, and indeed, it was moribund, the pulse was feeble, rapid instead of placing it with the beveled surface forand thready, hypotastic congestion had already oc-, ward and the shoulder projecting backwards, he recurred in the lungs, and the child was semi-comatose. commends the tube turned so that the shoulder will

tube was introduced into the trachea, but it failed to difficult indeed; but if the tube has an olive shaped give relief simply because the tube was not of sufficient length. It would not reach through the stricinto the cavity of the larynx, resting upon the vocal

it be pressed up again. The child was so near dead that tracheotomy was thought to be useless. To meet such emergencies as this I have had a much longer tube constructed, one that will pass entirely through such a stricture and consequently give perfect relief. The object in performing intubation in cases of bronchocele would be to give immediate relief, and to give us time in which we might perhaps reduce the tumor by electrolysis or the internal and external use of iodine; or these measures failing, we could then leisurely enucleate the gland. Bronchocele may produce death by pressure laterally, or by suffocation from pressure upon the trachea anteriorly; or a lobe of the gland may develop between the æsoph-

project forward and the beveled surface back-A case has been reported to me in which there was complete perforation at the base of the epiglottis from the pressure of the beyeled surface of a straight tube. The most perfect tubes are now made with the upper surface curved slightly backwards so that no pressure will be exerted upon the anterior wall. If we turn the tube around and place it with the projecting shoulder forwards, how much greater must be the danger from ulceration. Again, the author refers in his illustration to a tube with a shoulder broad posteriorly, a tube that has been discarded some time since, for it has been found that a tube with an olive-shaped head fits the larynx much better than the old tube. I think the author is mistaken about the head of the tube riding high and riding high and resting upon the arytenoid cartilages. It depends altogether upon the judgment used in the selection of the tube. If a tube is used larger than is appropriate for the age of the patient, it will be found that while the tube can be passed into the trachea without difficulty, yet the head will not sink into the larynx, and

While in this condition the largest size intubation then it will ride high and swallowing becomes very ture, and from the pressure of the gland, as rapidly cords, and swallowing is attended with but little difas it was pressed down in position so rapidly would-ficulty. In regard to the length of the tube, it would seem to me that little would be gained by facing in the way mentioned in the paper. My first making it shorter; indeed, this was one of the reaccase was about a year ago, the patient being brought sons of Bouchut's failure thirty years ago. You can to me from out of town. As it was my first case I readily see if we use a short tube, one simply pro- took particular pains to follow the regular method as jecting through the larynx, there would be much pointed out by those who had introduced it, and so greater danger from detachment of false membrane introduced the tube with the upper face looking forbelow the tube. In offering these criticisms it is ward and upward, that is, the upper plane at the enwith no unkind intent, or for the purpose of discourtrance. The child threw up the tube within ten aging attempts at improvement. While I have now minutes. I immediately replaced it, and while he performed this operation over one hundred times, remained in the office he was perfectly free in his and with a success rarely attained by tracheotomy, breathing and entirely relieved from stenosis. In

sabre sheath trachea with the subsequent stenosis, duced the other way, facing in the other direction. from pressure and atrophy. And that is not the taking the tube out, but I had more or less trouble recurrent laryngeal nerve is affected by pressure from tube four days and coughed it up himself. alysis. Thus we see cases where extirpation of the the subject, I again resumed the method of Dr. pressure from the goitre on the pneumo-gastric nerve no difficulty as yet in retaining it. I have had four causes irritation of the vagus centre of the brain, and cases intubed by the O'Dwyer method, with four reflex contraction of the muscles of the glottis. These deaths; three cases with the tube turned the other are the cases where goitre patients in apparently way, all recoveries. FERDINAND HENROTIN said: My position is finger, while if it is turned the other way you can

introducing a long tube is concerned, I simply start first introduced. the tube, and as it slips into the laryny withdraw the

perience of the last speaker that these patients do that arises from the endeavor to swallow water. not always swallow readily even when the tube is Dr. Hoadley, in closing the discussion, said: seated deeply in the larynx, and I am inclined to be- As I mentioned in the paper, I started out in this passages.

oyster in pieces and let it slip down; a custard and the tube for me he introduced it the wrong way, and the white of an egg that slip down easily, and that, they swallowed fluids better than I expected they with little pieces of ice to quench the thirst, has would. The next case I had I introduced it myself usually succeeded with me. The disadvantage that the wrong way, the same as he did the others. The I consider attaches to the short tube is that the ex- child had more difficulty in swallowing than the othpulsive effort at coughing would frequently cause it ers had; on the third day he coughed the tube up, to be coughed up. The length and weight of the and when I reintroduced it, it was in the way recomtube must be an element in keeping it in place. It mended by Dr. O'Dwyer, and there was a marked seems to me we are using too small tubes. I am improvement in his ability to take liquids. In fact, using the second size in a child of four years, and he swallowed better than the other two. He sucgetting along quite well. As far as the difficulty of cumbed to the disease six days after the tube was

Dr. F. E. Waxham said: In regard to the rubber obturator, and just as it comes out of the tube my attachment which I have recently devised, I certainly finger slips into its place and pushes the tube home, think it a great improvement. Some may not desire Dr. E. Fletcher Ingals said: I have had no to use the artificial epiglottis attached to the tubber practical experience in putting in the tube the wrong collar, in which case it can be removed and the tube way, and I do not know how well it may turn out, will still be a great improvement, inasmuch as, the but anatomically it is certainly wrong unless the head being small and surrounded by the rubber, it shape of the tube be modified. It may be that with will fit the larynx more perfectly, there will be less the head of the tube modified it would sink into the irritation, and ulceration will be impossible. I have larynx, as recommended by the author of the paper, recently saved two little patients in which this device but with the tube as constructed by Dr. O'Dwyer it was used, and have also employed it in other cases does not seem to me a safe procedure to insert it with advantage. I agree with Dr. Ingals that it is wrong side foremost, for fear of pressure upon the best to keep water from the little patients as far as epiglottis causing ulceration. As to the effects of possible. I usually advise ice-cream, a very little at deglutition, if the tube fitted and would set deep in a time, or that a small piece of ice be placed in a the larynx and remain there, of course the patient cloth and held in the mouth. This relieves the could swallow more readily. It seems to be the ex- urgent thirst without causing the frequent coughing

lieve that unless some device can be invented to matter of intubation really on my judgment as to the prevent the entrance of fluid it is better that the paposition the tube was designed to take in the larynx, tient should take none. Where I have introduced for I had not given the subject sufficient attention to the tube it has been for other physicians, so that I remember that the tube was designed to rest high in was usually unable to watch the subsequent treat the larynx, and my experience has been so very ment, but in those that have recovered I have in pleasant, so far as the non-interference with the funcsisted that they should drink absolutely nothing. In tion of the throat is concerned, that I have decided the last case I insisted upon this so strongly that I in my own mind that deep tubing is preferable to incautioned the parents if they gave the child a tubation. The cases that I have tubed in that manteaspoonful of water they would kill it. The child ner were all bad cases, and not in a single one could will want to drink very badly after the first twenty. I give a favorable prognosis. They were all promptly four hours, but it is not a necessity for a few days, relieved, and that was all I expected to attain from If no fluid is allowed the patient is not nearly as the tubing. I have recommended the short tube; likely to have bronchitis or pneumonia as when it is the only advantage that the long tube can possibly permitted to drink. The child may have ice, it may have over the short one is its weight, except in rare have enemas, and may have soft solids in abundance. cases, and then its length is of advantage. In the As to the length of the tube, I agree with the last majority of cases of laryngeal stenosis the obstrucspeaker that the long tube is the better. One of tion is entirely in the larynx, and when it does extend Bouchot's mistakes was that he made his tube too down into the trachea the probabilities are that the short. But the principal reason for his failure was child will die of continued extension, and in such a that he attacked tracheotomy; he not only wanted case the long tube can be introduced. In the nine to introduce his tube, but he wanted every one else cases I tubed in this manner I used the long tube, so to stop tracheotomy. I would like to know what I cannot say whether the short one would have resuccess Dr. Waxham has had with the rubber collar lieved the stenosis. In one autopsy where there was in preventing the entrance of fluids into the air laryngeal diphtheria there was no diphtheritic exudation in the trachea, so that the extension of the tube Dr. John W. Niles said: My observation so far to the seventh ring was unnecessary. In reference leads me to think that it does not make very much to the position of the tube resting against the epi-difference which way you introduce the tube as re- glottis, as in the O'Dwyer method, I would state that gards the patient's ability to swallow fluids. In the epiglottis folds down and bears first upon the neither way can this be done without exciting cough. shoulder of the tube, then closes its orifice, but it In the two cases in which Dr. Henrotin introduced cannot perfectly close the larynx. Dr. O'Dwyerhas

had ulceration of the epiglottis with perforation, close the tube by its automatic action of folding You might think it would be a great deal worse to down over it, I regard the rubber top as being wholly turn the tube around, that the pressure would be useless. Not only is it useless, but the valve standgreater upon the epiglottis, but when I turn the tube ing up in constant apposition with the epiglottis is a around it goes half an inch lower, and the projection source of additional and continued irritation. of the tube that is supposed to touch the epiglottis does not touch anything, and the mucous membrane | is not pressed upon at all. Introducing the tube in the O'Dwyer method it will not go into the larynx; you can push it down and still it can be felt above the larynx, so when the epiglottis folds over, it must necessarily come against the tube. By turning the tube around, sinking it well into the larynx, it goes down so far that in a small larynx you cannot touch it with the finger, it goes down as far as the attachment of the apex of the epiglottis with the thyroid State of Nebraska a Board to be styled the Nebraska cartilage. The epiglottis folds down over the larynx, State Board of Pharmacy. Said Board shall consist of the laryngeal tube is still free below it, resting on the the Attorney-General, Secretary of State, Auditor, vocal cord, so that it can produce no ulceration of Treasurer and Commissioner of Public Lands and the epiglottis. As to the vocal cords, Dr. O'Dwyer Buildings, and said Board shall appoint five examinsays that ulceration is rare in that situation. FUNGUS CEREBRI REDUCED BY PRESSURE.

Dear Sir:—An interesting case of cranial fracture, followed by fungus cerebri, removed by ligature, and reported in THE JOLENAL of February 5, prompts me to report a case somewhat like it, and with a like favorable result from different treatment.

F. M., aged 272 years, was kicked by a horse, on Dear Sir:—I have recently seen several commuthe left superior posterior parietal bone, crushing the the afternoon of the same day, and immediately made In 1849, directly after I began practicing mediation incision the whole length of the tumor; coagulacine, an old gentleman, a very warm friend, pro- ted blood, and quite a considerable amount of brain, following the knife. A conical incision enabled me before the American Medical Association in 1884, dura mater; brought the cut surfaces of the scalp together by sutures; and dressed with the water dressleaden tea-caddy I found in the house—it was in the ing words: country, some fifteen or sixteen miles from my residence—folded the plate to a proper thickness, and, copy of the "Talmudic Medicine" of Dr. von Klein, with a hammer made it concave. I then placed over which shall not exceed \$5.00 in cost for 500 octavo the growth two thicknesses of lint, smeared over pages, or at \$1.00 for each 100 pages, payable on a bandage, which was drawn tighter from day to day, until the entire growth was absorbed. In due time the external wound healed, and the child grew to be review. as bright and intelligent as the other children of the family. Very truly yours,

"THE ETIOLOGY AND CURE OF ASTHMA."

Dear Sir:—A paper under the above title recently appeared in The Journal which called out some comment to which the author has objected in the last issue (March 19). In this last note he seems to have gone quite as far as the reviewer in refuting his former claims.

From the comprehensiveness of the title and from the tenor of his paper one would naturally suppose he had some information to impart about asthma, but he now claims that he was not writing about asthma, but about "a rarer form of the disease." Every laryngologist, and probably nearly every general practitioner, knows that cauterization of the Capt. R. W. Johnson, Asst. Surgeon, ordered for temporary turbinated bodies will cure rare cases of asthma.

If the gentleman had entitled his paper "A Case of Asthma Benefited by Treatment," and had confined his subsequent remarks to a statement of facts as pointed out in the review, he would not have been troubled by the irritation into which he has wrought himself; but might have rested content with the knowledge that he had given a most excellent and interesting account of his own sufferings and the manner in which they were relieved. The charge which he makes of misrepresentation will be found wholly gratuitous by those who care to read the review. Very truly yours,

E. Fletcher Ingals.

64 State St., Chicago, March 20, 1887.

In the second place, while in use the gases from the who prosecute both the science and art of sanitation, deposit are constantly passing off into the room. the physician, the plumber and the engineer, have And thirdly, the rush of water is not always sufficient attacked this problem together and singly, month to carry the deposit well through the trap and into after month, year after year, each marked by unre- the soil pipe. Indeed, in certain cases, quite a pormitting thought, and plan, and experiment, until a tion is left to decompose and poison continuously substantial, if not a triumphant victory has rewarded the atmosphere. The next is the "Zane Sanitary their perseverance. These workers have brought Closet." This is much more complicated and in forth closets, numerous and various in style as leaves some respects a better closet. It has a double proof autumn, that not only squarely meet all foul and tection in the form of two water seals; one in the fatal eminations from all forms of human excreta, pipe and one in the bowl, and it uses more water, but flank, surround and compel to surrender all the Very similar in construction is the "Demorest." forms of bacteria, bacilli, micrococci and their vast. They are both plungers, and both leave flushing

progeny. The essential parts of all these closets are the bowl, the container, the trap, with water seal or seals, are generally very satisfactory to those who use supply soil and vent pipes. Some makes contain all them. My objections to them are that nothing the above parts in their construction, some only a leaves the bowl when in use, and will not leave it portion. The thought that has filled the minds of except when the handle is pulled up, so that they are all closet makers is how to control the gases—the not well suited for children, imbeciles and careless odors--and especially the death laden germs. With people. But in the opinion of Dr. Tracy, of New every form of closet, save one, the trap is relied on Vork, and others, the most threatening defect is in in the soil pipe, whether leading from closet, bath the plunging chamber, which, in time, is coated with tub or kitchen sink. Without this imperious neces- a very foul organic matter that is a favorable bed for sity called a trap, the more sewers, soil pipes, waste the rapid culture of disease producers. In many of pipes, and even ventilating pipes we put into our the most carefully plumbed houses of our town conhouses the more surely will they be dens for thieves taining these closets, diphtheria has again and again to steal our health, and threaten, and eventually take visited different members of the family, and the our lives. Our houses are but expensively con-supicions were centered on the foul flushing chamber structed receivers of foulness, and festering filth, as the cause. I only note this suspicion. My own containing "pestilence that walk in darkness and de-knowledge does not verify it. While there is no structions that walketh at noonday." What then, is trap closet I would recommend, that I know, I am the nature of this seemingly imperative necessity? very favorably impressed with a closet made by the It is simply a bend in the pipe leading from the closet, a half "S," three-quarter "S," "S" or "D," a bag shape, a bottle shape or a bell shape. But they are all but different kinds of bends. As the art of I would consider the time well spent, had I a house half or three-quarter "S" is preferred. I can say, with it. then, the trap "is only that and nothing more."

What is any house, however elegant in appearance, the water seal. And this little pool of water, often or expensive in construction, without either one or very impure, very offensive, and very foul, may be

Now, a word about some of the closets in daily flard Hopper." This is one of the most simple in The sanitarian of to day, to be at his best, should construction, having but a bowl attached to a four First, then, what can be said regarding water place, as now made, it does not use enough water. chambers.

These closets have many excellent qualities and plumbing is more and more advanced, the simple to furnish, in making myself thoroughly acquainted

The question is often asked, can we get something Behold then how great a matter a little trap pre- better than the common "S," or at least something which will assist in making the seal more per- copper cup, with or without a rubber ring that comes fect? Many efforts have been made and appliances up and surrounds the lower end of the bowl and adopted. Notably among them is the Bowers contains water on both sides of the end. The op-Trap." This is a rubber ball that floats upon the eration of this closet is as follows: Pressure being water seal, and being made very carefully, as is also made upon the seat, the cup is at once carried to the the trap, it fits accurately against the bottom of the side, the valves of both supply pipes open at the gipe and so remains while the closet is at rest, and is same moment, and two strong streams of water intended to assist the seal in effectually preventing flow, one around the rim, and the other dashing in a the escape of sewer gas. My experience with this thick sheet of spray across the lower end of the trap is favorable, but those who perhaps know much bowl before falling into the straight soil pipe. The more than I, object to it on the ground that gases action of these currents produces a rapid suction form a stratum immediately under the ball, and when into the soil pipe carrying with them instantly all deit is displaced by sewage, this stratum passes at once posits and gases. These currents are continuous, into the apartment. I have been much interested in and cease only when the weight is off the seat, at the study of another ball trap on a wholly different which instant the cup again takes its place and is plan. It is an invention of H. C. Lowrie, a member rapidly filled by the last proportions of water of both of the Denver Society of Civil Engineers. It is a supply pipes. Here we have an odorless closet, and rubber ball filled with shot, and for a four inch pipe, one that neither allows gases nor deposits to remain weight four and a half pounds, and so firmly is it an instant in the bowl, a quality no other closet has, seated that it takes twenty five pounds of pressure to of which I have ever read or seen. It was put to displace it. The trap used with this ball has a sort a crucial test in one of our plumbing shops. Three of elbow, or "race way" the inventor calls it, through of the approved closets were placed in a row with it which the ball rolls when displaced by the proper over the same soil pipe, a four inch, and filled for use. weight of sewage, only to at once take its place This soil pipe was heavily charged with illuminating again when the pressure has passed, and firmly keep gas, and although used repeatedly, not the slightest it, thus forming a perfect seal in all respects and do-lodor could be detected either during use or at rest. ing away with vent pipes of all descriptions. Of I have no hesitation in pronouncing it by far the best course, in the construction of these balls and traps, closet with which I am acquainted; and I say this in everything must be of the most accurate make, and the exact language required by the Government of the best materials, which must add considerably Pension office, viz: I hereby vertify that I have no to the expense of furnishing a house. This is to me interest either direct or indirect in this closet. It a great recommendation, as the most expensive ma- is called "The McAndrews Spray Seal Trapless terials of all kinds only should be chosen if they are Closet." of intrinsic value; for plumbing should be done regardless of cost.

She was received into the St. Joseph's Hospital, at pox or measles. How long can we be without epi- Fort Wayne, Ind., where I treated her for an enlarged spleen. In six weeks she left for her home, The question now presents itself, is there any other very much improved, the spleen being reduced algood way of disposing of excreta save by closet and most to its normal size. In March, 1885, I was again water carriage? I say most confidently, yes. In called to visit her, in consultation. I found a large city, town, village and country, let every hole, vault tumor occupying the lower portion of the abdominal and receptacle be cleaned, and filled with fresh and cavity; it was believed to be an extra uterine fibropure material, and having placed the privy upon a ma. During the consultation I mentioned the presolid and well-aired foundation, convenient to the vious history of the case, and the possibility of the house, and somewhat secluded, and if this privy is tumor being a misplaced and enlarged spleen. She six by four feet, place under it a box seven by four, died July 20, 1885. I made the autopsy and discovthis being kept off the ground by substantial stone ered that the tumor was the spleen. It had gravicorners, and this whole problem is solved, white tated downward until its lower portion occupied a purity, health, decency, and comfort are secured. portion of the pelvic cavity. The immediate cause

After reviewing the history of this case and noting in position for \$2.25. The projecting foot is cov-carefully the condition of the blood-vessels and the ered with a neatly fitting plank, which is all that is extent of the adhesions, I was strongly impressed displaced and set aside in the removal of contents, with the idea that, in this case at least, the enlarged The scavengers of our town are anxious to contract and displaced spleen could have been removed with for their proper care, removing contents without the success. So strongly impressed was I, that I deterknowledge or supervision of the owner, and dispos-mined, if in the future a similar case should present

In November, 1885, I was called to La Grange to the ash heap. Use lime, or earth or copperas if visit Mrs. McKinley. She had a tumor in the left there is supposed to be occasion, but which, with my hypochondrium and complained of pain and a sense daily experience of ten years is, in my opinion, not of weight in the same region. Her symptoms and necessary, the ashes alone from an ordinary house the history of the case pointed clearly to splenic disbeing amply sufficient. Another great advantage is, order of malarial origin. Tertian intermittents filled that the mass to be removed is so nearly odorless an important chapter in the case. She had tender-

The tumor, at my first visit, occupied the umbili-To those unacquainted with the absorbing and deceal region. The diagnosis being well defined, I preodorizing powers of earth, ashes or lime, I would scribed quinine in large doses, with iodide of potassay that they are marvelous. Those of us who study sium occasionally; this treatment was to be pursued our Bibles as well as sanitation, find that this subject persistently. In February, 1886, I visited England, was dignified and emphasized by the direct command and knew nothing of the progress of the case until after my return in May, 1886. About this time I "Thou shalt have a place also without the Camp, received a letter from her husband, in which he inwhither thou shalt go forth abroad. And thou shalt formed me that the tumor had increased in size, was have a paddle upon thy weapon: and it shalt be much lower in the abdomen, and that she was preg-

FIVE CASES OF LARGE VISIBLE PULSATING ARTERY ON THE POSTERIOR WALL OF THE PHAR-YNX. WITH REMARKS.

BY J. W. FARLOW, M.D., OF BOSTON.

Case 1.—E. N., a girl 13 years old, came to me at the Boston Dispensary, complaining of nasal catarrh and enlarged cervical glands; she had also an atrophic pharyngitis My attention was immediately drawn to two large, pulsating vessels on the back of tic gauze; and over these a firm snug-fitting flannel the pharynx, about quarter of an inch inside the bandage; over the mouth of the glass tube, carbol-posterior pillar of the fauces, and lying directly beneath the mucous membrane. By slightly depress-The patient was now removed and placed in bed, ing the tongue the lowest point of the pulsation was easily seen, the upper limit was a little higher than the base of the uvula. The vessels were nearly vertical, and the left one had a more marked pulsation than the right. To the finger the impression was given of an artery fully as large as the radial. The patient knew nothing of this condition of her pharynx. Thinking that the large cervical glands might, On the ninth day the first dressing was removed by pressure, be the cause of this pulsation, I watched carefully to see if the vessels diminished in size as the glands grew smaller. But such was not the case. The glands entirely disappeared and the nose much improved, but the pulsation continued as before. I ture 1 ever exceeded 102. Her appetite improved saw her the other day, eighteen months after her first

Case 2.—Mary C., 18 years old, came to me comthe hospital, and her recovery at the present time is plaining of nasal catarrh and some atrophic pharvngitis. There was a large, pulsating vessel on the posterior wall of the pharynx on the left side, as in pharyngeus to the outer side of the pharynx. After Case 1, but none was seen on the right. There were supplying these muscles, the tonsils and Eustachian no large cervical glands.

for post-nasal catarrh. On the back of her pharynx and supplies the soft palate and palatine glands. The were two large, pulsating arteries, almost an exact other passes to the tonsil which it supplies, anasto-

counterpart of Case 1.

and was seen at the Massachusetts General Hospital, by Drs. F. I. Knight and F. H. Hooper. No notes of the case are at hand, but Dr. Hooper thinks the large vessel was on the back of the pharynx, in my cases, the vessels were the ascending pharynabout halfway between the uvula and the posterior pillar of the fauces on the right side.

nasal catarrh. On the posterior wall of her pharynx on the right side was a large pulsating vessel, as in the other cases. The glands of the neck were small. The atrophy of the mucous membrane slightly enlarged. A sister, 5½ years old, has begin-the pulsating vessel to be seen more readily. ning atrophic pharyngitis and rhinitis, but no artery

constitute the most important substratum.

charges with blood parts whose vessels have been in irritability will yield promptly to the remedy. a contracted condition, and relieves other parts in But Trussewitsch's observations have taught him

which they have been unduly dilated; thus performing, so to speak, transfusion of blood into an anæmic part, and abstraction of blood from an engorged part. In this way may be explained the action of the drug in megrim and sea-sickness: the contracted cerebral arterioles are dilated, and more blood flows to the brain, being abstracted from the over-distended abdominal vessels. In this way also it relieves the heart work when contracted peripheral vessels retard the circulation by causing increased arterial pressure. The symptoms, therefore, that point to the selection of nitroglycerine in the treatment of diseases, belong to the sphere of the vaso-motor nerves.

Now, what are these symptoms? The paroxysmal nature of the attacks is characteristic of many of the diseases for which nitroglycerine is useful, this paroxysmal character indicating to a certain extent the absence of organic lesions and the frequent recurrence of exciting causes. Angina pectoris, megrim THE CONDITIONS FOR THE ADMINISTRATION and neuralgia represent this class of diseases for which the drug is suited. Sea sickness, certain forms In a most interesting paper in the St. Petersburger of anaemia, fainting fits, palpitatio cordis, etc., are Medicinische Wochenschrift, No. 1, 1887, TRUSSE- some of the acute angioneuroses for which it may be witscu recommends that in prescribing nitroglycerine employed. of internal organs; it is in these conditions that the remedy seems to act as a direct abstracter of blood from the vascular system of the congested organ. He considers these observations of especial importance, because we have nothing similar to them in medical literature, and because they raise the hope that in future it may be possible, by means of this agent, to check the progress of acute hyperæmia of an organ, in diseases of this kind, into inflammation, extravasation and other processes. In this way retrogression of acute pulmonary hyperæmia from inhalation of cold air or irritating substances—variously styled acute congestion, engorgement, pulmonary apoplexy—may take place; extravasation of blood into the brain after apoplexy from circulatory disturbances may be prevented; overfilling of parenchymatous organs-especially the kidneys-may be dissipated; violent symptoms of congestion to the heart or brain in climacteric or hæmorrhoidal cases may be lessened; and profuse menstruation may be controlled. It is evident that in this class of cases the congestion must not be a permanent condition, for attention has already been called to the fact that nitroglycerine does not exert any influence when the arterial tone has been permanently lowered by long continued engorgement or passive hyperæmia Trussewitsch remarks that in these cases of acute congestion he has found, coexistent with the congestion, a remarkably low and slow pulse—a condition which is generally recognized to be present in the non febrile period of acute pulmonary and renal hyperæmia. It is to be hoped that this new indication for the use of nitroglycerine will be confirmed by the further experience.

In the angioneurotic as well as in the congestive forms of disease, good results can be expected from nitroglycerine only if the vaso-motor system of nerves is normally developed, i. e., with normal function of medicine be continued for several weeks. its presiding centre in the medulla and its terminal purely neurotic attack—the symptoms completely apparatus in the arterial walls. Before prescribing disappearing before and after the paroxysms—it is Trussewitsch examines the pulse, as he considers its advisable to give 2 drops at once, or else to repeat character the best guide to the use of the drug and a drop doses every five, fifteen or twenty minutes. the size of the initial dose. His experience is that the To prevent a new attack and to cure the affection more contracted the radial artery the more rapidly the dose is repeated three or four times a day, and will it become dilated, and the less pronounced will an extra dose is given when the premonitory sympbe the secondary effects of the drug; the fuller the toms of the paroxysm are manifested. The fulness, pulse with a tense artery the less will nitroglycerine oppression, and pulsation in the head disappear more act upon it; and the softer the artery with a weak rapidly if the patient remains seated in a chair, in a pulse the greater will be the secondary effects, and well-aired room, and avoids everything that could the more readily will excessive general symptoms give rise to a flow of blood to the brain. When the appear. For this reason he dispenses in cases of the physiological effects of a dose cease to appear, the

that the equalizing effect of nitroglycerine on the first class only the normal dose-1 drop of a 1 per circulation can be utilized in congestive conditions cent. solution, in those of the second two drops after a trial dose of 1 drop, while in those of the third class he begins with a subnormal dose, 1/4 to 1/2 of a drop, so as to avoid the severe drug-symptoms. It is advisable to give women, children, and aged persons smaller doses, and he has made it a rule to give anæmic, weak, nervous, fatigued and frightened persons an initial dose of $\frac{1}{200}$, and to advance to the normal dose only after three to seven days. Organic heart disease is no contraindication. He has given it in cases of angina pectoris with insufficiency of the aortic valves, and dilated aorta, and with flabby, dilated heart without bad effect. Those addicted to the abuse of alcohol seem to suffer more severely from violent and long-lasting headache. In persons who seem not easily impressed by the drug, and to whom, on this account, large doses have been given, this violent headache may not make its appearance for several hours. Caution must be exercised in general atheromatosis of the arteries.

> By his trial dose Trussewitsch attempts to find the capacity of the patient for the remedy, and it serves to acquaint the patient with the manner of taking it. In his opinion, the good action of a dose of nitroglycerine is in proportion to the subjective symptoms to which it gives rise. These subjective symptoms are cerebral congestion, dulness, moderate pain, and pulsation, and their onset is an indication that a favorable effect will follow the given dose. The objective sign that the drug will act favorably is a change in the pulse, consisting in an increased frequency, increased duration, and increased softness of the radial artery. If no cerebral symptoms are complained of, and if the pulse does not weaken and become excessively soft, the dose is increased to 2 drops of a 1 per cent. solution. Usually the treatment may be begun with a single drop, and the peculiar physiological effect is experienced even if the

has also ceased, and the dose must be increased; When he finds that nitroglycerine does its work, only by a single drop, however. Now both objective dilates the vessels, and reduces their tension and the and subjective drug-symptoms are again promptly blood-pressure in chronic diseases, Trussewitsch is manifested, and the disease symptoms again vanish, accustomed to gradually advance to the maximum the patient in a short time learning what to look for, dose, say to doses, and then as gradually go back to if it should do him good. In diseases of long durathe original dose. He then interrupts the use of the tion, as in angina pectoris due to organic causes, in drug, or drops it altogether. This plan has been found which nitroglycerine can only serve as a palliative, of especial advantage in Bright's disease. He somegreat care must be taken in increasing the original times find it advisable in chronic diseases to comdose. It is better in such cases to give an extra drop, bine with the nitroglycerine treatment, the use of only just before a paroxysm, and the smaller doses other drugs, as digitalis in weak, irregular heart-action, in the intervals, or else to stop the medicine entirely cocaine or morphine in neuralgia, and amyl nitrite in during the latter and only give a full dose before and violent attacks of angina pectoris, when it is not deduring an attack. For patients who have become sirable to augment the dose of the leading remedy. accustomed to nitroglycerine, the dose may be gradu- It is of course very necessary to combat any constially raised even to 10 drops. Trussewitsch has found 'pation present, and for this purpose uses an aloes and that if the use of the drug be interrupted for ten or podophyllin pill, or an emulsion of castor-oil with fourteen days, on recommencing the treatment the glycerine. A strict dietetic regime is to be insisted original, smaller dose will again give rise to pro- on in the treatment of diseases with nitroglycerine; nounced physiological symptoms with their coinci- bodily and mental quiet is necessary; change of dent prompt controlling action on the paroxysms; temperature, excessive exercise, long-continued brain and this peculiarity of the drug makes it unnecessary to unduly increase the dose simply on account of the patient's having become accustomed to the dose.

The best method of administering nitroglycerine, says Trussewitsch, is to drop the dose on the tongue, or to dissolve a chocolate tablet of nitroglycerine in glass-stoppered vial. Many patients always carry a the mouth, so as to bring the medicine into most in- vial of nitroglycerine and a pipette with them, so as timate contact with the mucous membrane of the to be able to take their dose at a moment's warning. upper digestive tract. reading, studying members of the profession; it does in the Jefferson Medical Collge in 1827. not affect those who do not attempt to make progress after leaving the medical colleges; it does not affect the drones in the profession. We think it will be agreed that such works are as much a necessity for the State at large as for the profession, since it is now well recognized that the highest aim of the profession is preventive medicine. Would it not be well for the American Medical Association to take some action in regard to this matter at its next meeting, and memorialize the General Government, setting forth the injustice of this tax.

COLLECTIVE INVESTIGATION OF DISEASE.

Only a very limited number of the blanks prepared and distributed to members of the profession in this country by the American members of the International Committee for Collective Investigation, organized at Copenhagen, 1884, have been returned as re-lative body. quested, on or before January 1, 1887. The blanks related to rickets, acute rheumatism, chorea, cancer, and urinary calculus. As the time is near when the several members of the Committee are expected to make their returns to the Secretary-General of the International Committee, it is very much desired that all who have received copies of the blanks alluded to and have filled any of them, would return the same without further delay to Dr. N. S. Davis, 65 Randolph Street, Chicago, 111.

CHOLERA IN SOUTH AMERICA.—From the Weekly Abstract of Sanitary Reports, from the office of the Supervising Surgeon-General of Marine Hospital Service, dated March 24, we learn that the latest dates from Buenos Ayres, Feb. 5, represent the prevalence of the cholera as decidedly diminishing throughout the Argentine Republic, with a prospect of its early disappearance from that country. But in Santiago and the departments of Aconcagua, Andes and Quillota of Chili the disease continues active and fatal, particularly among the poorer classes of the people.

SOCIETY PROCEEDINGS.

CHICAGO GYNÆCOLOGICAL SOCIETY.

Regular Meeting, Friday, January 21, 1887. The President, Chas. Warrington Earle, M.D., IN THE CHAIR.

W. W. Jaggard, M.D., Editor.

Dr. Charles T. Parkes reported a case of

INTERSTITIAL PREGNANCY, WITH REMOVAL OF THE PRODUCT OF CONCEPTION THROUGH THE UTERINE CAVITY,

with the exhibition of the specimen.

this mass down so that it could be removed.

December, when her husband came into my office ceeded in bringing away a large mass of flesh, which

and showed me a little piece of bone, or a piece of hard substance that looked like bone, which he said his wife had picked off the napkin. It had the appearance of fetal cranial bone. He asked me what it meant, and I told him I could not say but would see his wife. On inquiry, I found that the flow of blood had ceased, but the flow of pus had increased, and occasionally there was extruded a piece of this bony substance. On digital examination, I discovered the os and cervix filled with particles of this bony substance, and after removing them I found it impossible to introduce my finger into the cervix. The external tumor was reduced considerably in size, and was low down in the pelvis, and could be felt projecting through the anterior vaginal wall. I then decided to dilate the cervix. I introduced as many The specimen, which I exhibit to night, comes tupelo tents as I could get into the cervix—at first from a case, which has been of extreme interest to but two of fair size—to their full length, and allowed me, and is, I think, the remains of a conception, them to remain there over night, when I removed which was certainly outside of the uterine cavity, them and introduced four more. That evening I reand which I succeeded finally in delivering through moved them, and the cervix was dilated so that I the womb. It was taken from a lady, 33 years of could easily introduce my finger. As I had examined age, who, seven years ago, was delivered of a child the uterus with the sound at my first visit, and it at full term. The child is now living. A year after went around this mass to its full length, I supposed that, she was taken with hamorrhage and had quite. I had nothing but a fibroid to deal with. When I a severe bleeding, every month or second month, for had dilated the cervix with these tupelo tents, I two years. Some time after her pregnancy she was found I could not get at the mass of the growth, my operated upon for laceration of the cervix, but the finger going into the cavity of the uterus. At the operation had little effect upon the hæmorrhage, distance of one joint and a half inside the cervix, I Two years ago she again became pregnant, and was found a little opening, and projecting through this delivered at the proper time. This child is still liv- opening—about as large as the end of a pencil ing. The lady came under my charge last Septem- were some of these particles of bone. Then the ber for hæmorrhage from the uterus. On examination, query arose, how was 1 to get into this cavity, and I found a globular mass in the lower portion of the what was it? a double uterus, with multiple pregabdomen, as large as two fists, very hard and tense. nancy at the last conception—one delivered and the When I felt it through the abdominal walls, my im- other retained? On the 24th I introduced tents and dilated posed the action of the ergot would gradually force it, so that I could introduce two fingers very readily, and finally got one of my fingers into the opening in My visits ceased and I heard nothing more from which this body (indicating the specimen) was found. the patient, except an occasional report that she was. I then began to separate it and pull it away, getting getting along in the same way, until the 10th of hold of it with strong forceps. Sometimes I suclooked exactly like that from a macerated feetus, the doctor attempted to use Elliot's forceps, but, because skin macerated and parchment like. This was con- of the high and abnormal position of the head above tinued up to the 30th. Passing over the New Year, the pelvic brim, he had desisted from his purpose. and allowing the patient to rest without interference, Upon examination, I found the os widely dilated, the on January 9, I introduced four tupelo tents, a little crown of the head presenting. By introducing the longer than the ordinary, and fortunately succeeded hand into the vagina, my fingers directed toward the in getting one or two into the opening in which the left sacro-iliac synchondrosis, encountered and passed body was found; so when I removed them that slightly beyond an extremity of the head ovoid which evening, I was enabled to bring away the entire I supposed to be the occipital protuberance, but mass and pass the finger into the eavity afterwards, near it was so distinct a fontanelle as to lead me to It was very irregular, as though the uterine tissues examine the opposite extremity of the head. Passhad been forced into the irregularities of the foreign ing the hand deeply behind the left foramen ovale body. Since that time the patient has improved, the and well above the pubes, the fingers embraced the bleeding has ceased, the uterus has diminished in occiput; sweeping well backward again over the size, and she is up and about the house. I have had side of the head they traversed the temporal region all parts of this specimen examined under the micro-till the ear was reached and carefully outlined. Still scope. The fleshy mass shows connective tissue, further backward the fingers passed over the frontal muscular fibres, blood-vessels and hairs. The osseous material shows all the characteristics of feetal

THE PRESIDENT, asked if there was a history that would lead one to suppose that at any time during her invalidism there was a pregnancy, or a pelvic hematocele, or anything of that kind?

Dr. Parkes said, that at the time of her last pregnancy, she was very large and yet was delivered of a child that weighed but six pounds. Her abdomen was very large for some time after the delivery of this child. Again, there is a history several years back, of a period when menstruation ceased, and she supposed she was pregnant, but nothing came of it.

DR. W. W. JAGGARD said that the interesting specimen presented by Dr. Parkes was a typical lithopædion—a calcareous capsule, containing the fœtal structures infiltrated with lime salts. He thought the diagnosis of interstitial pregnancy highly probable. It was impossible to make a positive diagnosis without a post-mortem examination of the maternal organs. Carl Braun (Lehrb. d. g. Gynäk, 1881, p. 128) was responsible for the statement that the formation of a lithopædion occurred only in case of tion of a *uterine lithopadion* occurs infrequently in had risen above it, so that the power of the vectis as the human female, but is not unusual in ewes, a tractor would not be available, seeing that the fore-Koeberlé (Gaz. Hebd., No. 34, 1866) extracted by head, the opposite end of the lever I proposed to abdominal section a lithogradion from the rudiment- move, was not fixed but floating, the feetus yet restary horn of a uterus bicornis. The formation of a ing with the equators of the head well above the lithopædion, therefore, was not a reliable sign in the brim. As a lever to keep the occiput in proper redifferential diagnosis between uterine and extra-lation to the inlet, the "Roonhuysen" would have uterine pregnancy.

Dr. John Bartlett read a paper on

DYSTOCIA; A CASE OF MALPOSITION OF CORD.

eminences which had at first been mistaken for the occipital protuberance. The head was floating above the pelvic brim; the frontal region sinking somewhat below the plane of the superior strait. The crown of the head rested gently upon the pubes, while the occiput rested so far forward over the pubic bones as to be distinctly appreciable to sight and touch from without. Having determined the position of the head, I proceeded to inquire the cause of its detention; for it did not impinge with force upon any portion of the circumference of the brim. Passing the fingers along the side of the head I felt for the cord around the neck. A coil of cord was immediately encountered, and pressing a little farther upward a second, third and fourth coil were detected. I felt authorized to announce to Dr. H., as the cause of the dystocia, the suspension of the head above the brim by the cord shortened by four coils about the neck. The fingers were passed about the occiput and it was pressed downward and backward, throwing the forehead backward and upward above the brim and bringing the occiput slightly into the pelvis, the pains meanwhile having a decided effect in assisting the manœuvre. I now intended to seize the ocextra uterine pregnancy. Spiegelberg (*Lehrb. d.* ciput with the vectis, and so deliver. Upon trial *Geburtshülfe*, 1882, p. 342) however, indicates with the fingers, however, I appreciated that, as the that this proposition is too general. The formation occiput had descended into the pelvis, the forehead served admirably; but in order to make available traction upon the head it would be necessary to lay hold of it with the forceps. Accordingly, with very little trouble, though locking was effected within the Recently I was requested to assist a younger phy- vagina, the head was seized with a well curved Simpsician in a case of midwifery. Dr. H. had been son's forceps, and readily brought down. The excalled some hours before my coming. He found a pectation was, as soon as the head was delivered, to healthy, well built woman in labor with her eighth place quickly two clamp forceps on the cord and cut child, hitherto she had had no difficulty in her con- it between these, in order to escape the embarfinements. She had been in labor some hours, and, rassment which the several coils about the neck although the pains were very strong, the os fully dimight occasion. The first loop, however, was easily lated, and the head presenting, no progress had been -drawn over the head, the other coils were then readily made. A midwife had been in attendance. The released. The child which weighed eleven pounds

breathed at once, seeming but little affected by the only when circumstances prevent the head being

some comments upon the mode of determining the the vaginal examination was made after Smellie's position of the head in labor. From time immemo method. The steps of the procedure have been rial, it has been the custom of teachers to describe given in detail with the purpose of illustrating his with particularity how the position of the head may teachings. be determined by the tips of the fingers by means of the sutures and fontanelles. Whatever skill or tact the position of the child in head presentations by others may be endowed with, or may have acquired means of sutures and fontanelles is not as difficult to in such methods, for myself I wish emphatically to the physician, who has been in attendance during a declare that such examinations are often entirely case of labor as has been stated this evening. The insufficient to furnish me with the desired formation; gradual descent of the head into the pelvis will perand that now, after years of careful observation, I mit the recognition of the landmarks by repeated exam not unfrequently at a loss to determine the posi- amination with the finger. MEDICAL SOCIETY OF THE DISTRICT OF COLUMBIA.

Stated Meeting, February 9, 1887.

The President, Jos. Taber Johnson, M.D., IN THE CHAIR.

Dr. H. D. Fry read a paper entitled,

THE VALUE OF THE ANTISEPTIC METHOD IN OB-STETRIC PRACTICE AND ITS APPLICATION TO THE FORCEPS OPERATION,

and exhibited Breus' modification of Tarnier's forceps. He spoke of the advances which had been made in recent years in the practice of obstetrics, and of the reduction of childbed mortality that had followed these improvements. He directed attention more particularly to the germ theory of disease in relation to the pathogenesis of puerperal fever, and to the adoption of antiseptic precautions for the prevention of the affection. The brilliant result that had besides "germs" kill? He said that he never had a followed the application of this line of treatment in serious case of puerperal fever after the use of formaternity institutions was mentioned, and the anti- ceps. He recalled one case of a primipara whom he septic precautions demanded in the forceps opera-delivered with forceps, and in ten days she was well. tion were then dwelt upon. These precautions differ but little in detail for the various obstetrical opera-sistance and she was six weeks in getting up. Another tions, and those applicable to this one may be employed for others when modified by changes to meet the exigencies of particular cases.

The objects sought are three fold:

 Preventing the transport of germs to the genital. canal of the woman.

2. Killing those which clude our vigilance, and

3. Limiting the production of traumatic injuries as much as possible.

Dr. Fry then applied these principles to the forceps operation, and stated the rules to be observed in such. practice.

Dr. S. C. Busev asked Dr. Fry if he had any sta-chance of infection.

outlined by Dr. Martin. In the last type this treat-puerperal fever following the use of forceps and with-

Dr. L. Mackall asked how long Dr. Fry had

Dr. Fry replied to Dr. Busey, that he had no ineum, there was usually no rise of temperature above 100°. In but a single case has he seen, in two years, "milk fever," and that was when he had forgotten to bring his tablets with him. He did what he could in the way of washing his hands, but the temperature reached 102 on the second day.

In reply to Dr. T. C. Smith as to what he thought the mortality of private obstetric practice ought to

be. Dr. Fry replied, about 25 per cent.

Dr. T. C. Smrth, quoting from the Health Report of Washington, for the year ending June 30, 1885, said that twenty-nine deaths were put down to puerperal fever. There were also 3334 births reported. which makes the mortality less than .9 per cent. The births probably reached 4,000, as all of them are never reported, which makes the per cent. even lower. The twenty-nine deaths were from various causes, all being put down under the general term "puerperal fever." When we recollect that a large majority of the births are in charge of midwives and in colored women in the worst possible hygienic surroundings, is there any wonder that there should be twenty nine fatal cases? Moreover there were 393. illegitimate children and 391 stillbirths, both conditions bearing directly upon maternal mortality. Are there not sufficient causes to indicate that something

At her next labor, he arrived too late to be of aswoman he had delivered three times with forceps, but on the fourth he used neither ether nor forceps, and both he and she were sorry for it. He mentioned two other cases in which he had used the forceps, in spite of torn perincums, both made a rapid recovery.

He thought that douches during labor remove the mucus, the natural lubricant of the vagina, and that after labor they are worse than useless, for if nature had intended the parts to be antiseptic she would have made them so. In his opinion the lochia are antiseptic, for they plug the open absorbents, and if they are removed by douches there is an increased If we expect to keep out tistics showing the relative proportion of cases of germs, we must go back of the vagina into the uterus,

where there is a large surface of open mouthed veins ready to absorb them. Yet he ventures to assert tioned with surprise the fact that only twenty-nine that there are not a half-dozen doctors in Washing- women a year died of puerperal fever, when we conthere were "only" twenty-nine deaths from puer-flammatory diseases which are destructive to the

Dr. C. W. Johnston said that Dr. Smith menton, who wash out the uterus in all cases, or even sider the fact that a great number are "colored" three who use intra-uterine injections after the women with the worst hygienic surroundings, etc. So forceps. He thought that in a population where far as his observation goes, and he believes the exthere was so much bad hygiene, illegitimate preg-perience of the President agrees with his, he finds the nancies and abortions, that it was surprising that colored race peculiarly insusceptible to certain inwhites. In his service at the Central Dispensary, in Dr. A. Y. P. Garnett said, that now a days when about 500 colored and white women, equally exposed any man opposed antiseptics, he laid himself open to to disease, he found relatively fewer colored women criticism. He thought that individual experience suffering from pelvic inflammation than he did white was worth more than all the hospital statistics put women. Among the colored there are frequent cases together. He has a pair of forceps with which he of venereal disease, but even in those with the sohas delivered sixty-two women; he has never used called "latent gonorrheea" he has been able to find

Dr. Mackall said the statements made by Dr. great value of Listerism was in the systematic clean- Fry had made more impression upon him than all the liness which it introduced into medicine and surgery; statistics. It is true that he thought he had seen but this, with better hygienic surroundings, was more one fatal case of puerperal fever, and that in consulpotent for good than the killing of germs by anti-tation, he had always considered himself lucky to get septics. He expressed little faith in the germ theory, off without trouble after forceps delivery. In his Dr. S. C. Busey has more than once committed experience there has usually been more or less offenhimself to antiseptic obstetrics. He may not follow sive discharge in these cases. He does not believe the details of some of its most enthusiastic followers, that there is a specific germ for puerperal fever, but but he always, to a greater or less degree, follows the some malign influence conveyed to the woman, from antiseptic treatment in puerperal cases. Dr. Smith either a cadaver, a case of erysipelas, or something was wrong if he thought that those who adopted this of that sort. Formerly we were unable to stop the save every puerperal woman. They claimed, and it calomel, etc., but lately he has seen severe cases had been proven, that antisepsis had greatly reduced checked by bromo chloralum, which was the form Smith had quoted were only accurate in showing the result can be obtained from antiseptics in an infected number of deaths, but were valueless in regard to the system they must be infinitely more valuable as a

Dr. Mackall asked Dr. Fry if he has had any to success in every case. They may be sometimes cases of mammary abscess since using antiseptics. overdone, but we cannot tell in which they may be He has had several cases, all following fissures of or safely dispensed with. We do know there is vastly about the nipples. He understands it is claimed that

is going to have a short labor, but the pains gradually rything is dangerous that is not absolutely necessary. diminish in intensity and the head stops in its descent. The dangers of prophylactic intra uterine injections creased by their use, we must find some means to ber of cases, he omitted the injections. The morlessen the mortality, and this we seem to have in bidity was fifty per cent, greater in the cases that antiseptics.

the class of patients which Drs. Smith and Gleeson lay, however, must not be permitted many hours. speak of as being attended by these women. It was after the use of forceps; without them he has had cannot be used for intra-uterine injection without ingoes on to argue the question in such manner as to mercury 1 to 20,000 is strong enough to destroy the make one believe that the universal application of vitality of micro-organisms, and yet it is used for forceps would be desirable. In the case which Dr. intra uterine injection in the proportion of t to but not in the fourth, and the patient did well after treatment are not attributable, as Dr. Smith sugall the labors except the last. Dr. Fry supposes that gests, to the use of modern and well-built hosthe same indications for the use of instruments expitals. The success is equally great in the older inisted in the last labor as in the others, and they should stitutions, which formerly were scourged by puerperal have been used.

Dr. Smith's objection to the use of vaginal douches pital illustrate this fact. during labor, and his theoretical ideas regarding the unless it is protracted. He does, however, without exception, employ them before and after the use of forceps or any instrumental interference. He does not approve of antiseptic vaginal injections during the puerperium unless demanded by some complica- gland lobules through fissures of the nipple. tion—fetid lochia, fever, etc. He quoted from an article by Dr. Baruch, of New York, the results of a number of maternity hospitals, all of which employed antiseptic precautions. These precautions were much the same in all of the hospitals except one class used vaginal douches during the lying in, while the other only made use of them when specially indicated. The advantage, as demonstrated by percentage of recoveries, was strongly in favor of the latter.

According to Dr. Smith, if prophylactic douches

need of forceps is increasing. One supposes that he rule of antiseptic treatment, which teaches that eve-Ergot has no effect or is dangerous; it may be such ave been demonstrated by Hoffmeier. In a series cessful in starting up pains or it may fail, chloral has of cases, over 200 in number, he administered an failed; and finally resort to the forceps is necessary, intra uterine injection as soon as labor was com-If, as seems probable, the danger to the mother is in-pleted, and in another series of about the same numwere treated by the injections. Even when fever Dr. Fry, in closing, said that puerperal fever does exists, intra-uterine injections should not be used not occur often in the practice of midwives and in until vaginal douches have failed to give relief. De-

Dr. Garnett attributed to cleanliness the success this fact, among others, that led Semmelweiss to make of the antiseptic system. It is, indeed, the basis of the investigations that subsequently laid the founda- that system, but epidemics of childbed fever were tion for antiseptic treatment. The disease is far more not arrested until antiseptics were employed. When prevalent among the patients attended by practicing. Semmelweiss began his labors at the Vienna Obphysicians, and the infection is probably conveyed stetric Clinic, he found a maternal mortality of more by the examining finger of the obstetrician. - 5. The diathesis may be latent from lack of circumstances awakening it into existence, as in the case of those leading lives of luxury and ease.

In conclusion, he remarked that the absence or suppression of the emotional temperament may retard or altogether avert the final catastrophe.

On this occasion he introduced to the notice of the Association two new antiseptics and disinfectants, which he had tested with very satisfactory results in his own practice. These are glycozone, consisting of chemically pure glycerine with four volumes of ozone, and solution of peroxide of hydro-gen, and they both possess the advantages of being DUTIES OF OFFICERS SERVING IN THE MEDICAL DEPARTMENT, U. S. ARMY, FROM MARCH 19, 1887, TO colorless fluids.

As Mayor Hewitt was prohibited by the law from appointing a physician successor to General Shaler, as President of the Board of Health, he did the next best thing by giving the position to an expert in sanitary science outside the profession. Mr. James C. Bayles, the Mayor's selection, for the past sixteen years has been editor of the Iron Age and Metal years has been editor of the *Bron Age and Metal* (Ft. Adams, R. I.). S. O. 62; A. G. O., March 17, 1887. *Worker*, and has long been considered an authority Capt. Frank Reynolds, Asst. Surgeon (retired), died March 4, on drainage and sanitary engineering. In addition, he is a gentleman of much public spirit, and while his appointment has been a source of chagrin to the politicians, the community in general has every reason to be satisfied with it.

At the commencement of the University Medical School this year there were 151 graduates; at that of the Bellevne School 134; and that of the Long Island College Hospital, in Brooklyn, 30. tieth annual commencement of the New York College of Veterinary Surgeons and School of Comparative Medicine, was held at the Carnegie Laboratory March 16th when the address to the graduates was made by Prof. Joseph H. Raymond, of Brooklyn, and the diplomas were presented by the President, Dr. Wm. T. White. This is the oldest veterinary school in the country, having been chartered in 1857, and its friends have of late been interesting themselves greatly in its behalf; so that it is now provided with a most excellent Faculty, and with every needed facility for the successful scientific and practical study of this department of medicine. The same author, in speaking of spasm of the glottis, No medicine was employed. There was no return calls attention to the fact that it occurs more freof a single symptom except upon one occasion, there quently in boys than in girls and almost exclusively was incontinence of urme. He has continued to between the sixth and twenty fourth month. I think grow stronger, and is to-day, Oct. 15, 1881, brighter that every case that I have seen of this trouble, except one, has occurred in boys. In all that I have To better understand this subject it will be well to examined I have found either congenital phimosis or adherent prepuce. Removal of these brought relief. Might we not consider that there was some connecting diseases of the bladder, which commenced by tion between the two conditions?

various affections of the genito-urinary organs of child-that a sacro-lumbar neuritis may be progagated to ren, such as incontinence of urine, intermittent flow, the cord in diseases of the bladder. hæmaturia, priapism, etc., were due to phimosis, and that Sayre had pointed out the important fact that lieved immediately after the removal of genital irrireflex paralysis in various forms of spastic contractation and believed that this was more than coincitions, chiefly of the lower limbs are due to the same dent; moreover, he was firmly convinced that reflex cause, being readily curable by circumcision, says: paralysis was possible. Dr. Hammond also admits "In addition to these I have seen general spasmodic the possibility of preputial irritation giving rise to affections in children resembling chorea, resulting paraplegia. Dr. Seguin has never seen reflex paralfrom congenital phimosis." He also states that he ysis from irritation of the genitals of the male, but has known it to be a cause of impotence in the adult. had seen reflex nervous troubles, and believed that Further on he says: "Every child who has congenital the genital irritation should be relieved. He had phimosis ought to be circumcised, and even those met with paralysis from irritation of the deep urethra who, without having phimosis, have an abnormally and uterine disease. Cure of the uterine disease was long and lax prepuce would be improved greatly in followed by rapid recovery from the paralytic sympcleanliness, health and morals by being subjected to toms. Dr. Campbell Black has seen hæmaturia, the same operation; and it would be well if the cus-dysuria, incontinence, retention of urine, reflex partom of Eastern nations, whether it be regarded as a alysis, epilepsy, chorea, as well as spermatorrhea, religious rite or only a time-honored custom were in- prolapsus ani, and other troubles from genital irritatroduced amongst us."

are motor spinal paralyses. Brown Sequard attri-indications of nervous disturbance in childhood. butes the origin to chronic irritation of the genitoparts. Levisson experimented by compressing the uterus, kidneys, intestine, or bladder of rabbits, and

varnish, tremor, hyperæthesia, partial anæsthesia, increased reflex action, spasms and paralysis. Examination disclosed a dilatation of the cutaneous vessels, of the capillaries of the lung and the ramifications of the vena porta, hyperaemia of the meninges and a dusky redness of the cervical cord. If the animals survive a certain length of time, proliferation of the neuroglia occurs with atrophy of the nerve tubes from compression. Rosenthal, quoting these observations, says: "Thus the irritation of the cutaneous nerves produces a reflex paralysis of the pin hole, so that on retraction no part of the glans centres of vascular innervation in the cord." Now, or only a minute portion of the uretheral lips could if this follows from irritation of the cutaneous nerves, be seen. Second degree, in which all or a considcan we not expect as much from irritation of the erable part of, but nothing beyond the utheral orifice of the nerve trunks or of the genital organs. He that only six have normally formed prepuces, and cites a case of a girl, aged 23 years, who was relieved that from complete or the first degree of phimosis to of a paresis of three week's standing, by the removal which class more than one-third of the cases belong, of a needle deeply imbedded in the vagina.

Leyden reported three cases of paraplegia followsymptoms of motor and sensory irritation. He found Erichsen, after stating that Bryant had shown that diffuse softening of the cord in two cases. He thinks

Fourth degree, tion of the bladder had given negative results, whilst elongated prepuce, projecting more than a quarter a careful examination of motion and sensation showed of an inch beyond the glans, but capable of entire a diminution of the various forms of sensibility in retraction. Fifth degree, normal. It will be obthe legs; in the trunk there was abnormal excitability—served that of these cases eighty-three have phimosis; the number steadily declines to normal. I would mencing tabulation, this association was remarked, thorities since the War, I will reproduce it here, Furthermore, I asked my friend, Mr. Morant Baker, merely to introduce the remarks I am about to make to inquire for me about the prevalence of hip disease at the Evelina Hospital, which is largely used by Jews. He tells me that few children are there admitted for hip disease, and that most of those so received belong not to Jewish, but to the Christian community. The important fact, however, is simply, coincidence of phimosis and hip disease—a coincidence which I should never have dreamed of or imagined, had it not been forced upon my observation. Upon the mode in which the one influences the other I would rather not speculate further than to point out that phimosed children have facile, frequent and often long continued priapism; that this condition, unnatural in the infant, must produce after a time a certain irritability or irritation of the lumbar spinal cord; that from this part the various nerves of the pelvis and lower limbs are given off; that the influence of spinal irritation on the trophic nerves is well known; and that just at this particular period large trophic changes are in progress about the hip joint." During the time that he was collecting these 100 cases in boys, he met with 74 cases among girls. In a large proportion of them he found vulvitis, vaginitis,

Dr. Sayre noticed this same coincidence, and connected the condition with hip joint disease by the supposition that the majority of cases of this affection start from a fall or injury. The increased muscular debility from reflex irritation readily contributes to these falls.

Charcot, speaking of urinary paraplegia, says: "The very number of the cases in which we see paraplegia appear in the course of disease of the urinary passages is of itself enough to show that the phenom- GENERM. ORDERS, I enon is no chance coincidence.'

From the foregoing I think that we are justified in the conclusion that phimosis and adherent prepuce give rise to varied troubles of more or less gravity, manifesting themselves either in the muscular, osseous or nervous systems; and that the removal of these abnormal conditions of the penis frequently affords marked relief, and at times perfect and permanent cure.

THE IMPORTANCE FOR INSTRUCTION IN FIRST AID TO THE INJURED.

BY W. THORNTON PARKER, M.D. (MUNICH).

OF NEWFORT, R. L. LATE A. A. SURGEON U. S. ARMY.

In 1884, while acting Post Surgeon at a lonely frontier station, I became very much interested in Medical Director may have been, it is very gratifying the work of the New York State Charities Associa tion. I had been in correspondence with this organ- ally awakening to what has been proven an absolute ization for some time, before it occurred to me that necessity in foreign aimies. Probably in no other some useful practical work in this direction might be country has this matter secured the attention and won accomplished in the United States military forces, the success which has attended this humane and I accordingly prepared the following letter, and as I practical movement in England.

also point out that these are not fortuitous coinci- have been informed that it was probably one of the dences, because for two years at least before com- first on the subject sent to our military medical auon military first aid to the injured. I have never received any reply to the letter, not even an acknowledgment of its receipt, and it was probably ignominiously pigconholed:

TO THE MEDICAL DIRECTOR DEP'T OF THE MISSOURI:

Sir:—I beg leave to call attention to the great success of the New York State Charities Association in organizing societies in various sections of the country for the purpose of affording in-struction by lectures, illustrations, etc., in "First Aid to the Injured." The efforts have met with much general encouragement from the public, and their good effects have been recognized. It has occurred to me that it might be advisable to have something of this kind attempted at our military posts, providing suitable instruction in "first aid to the injured" to both officers and men. It undoubtedly frequently happens that officers in command of small detachments, deprived of the services of a surgeon, are called upon to extend aid to the sick and wounded, and although on more than one occasion officers have been found who were not only ready, but able to offer valuable assistance, yet a careful instruction in the course suggested would enable them to more fully afford relief, and save considerable surtering. At all of our larger posts, and especially at 1 ort. Leavenworth, this course of instruction could be very easily carried out, and suitable appliances being already on hand, little if any expense would be incurred to ilinstrate the learners. It is reasonable to believe that many officers and men would be interested in these lectures, and only good would result to the Army by a general profuding nymphæ or nymphæ covered by a cuticular surface.

Dr. Savre noticed this same coincidence, and con.

Act. Asst. Surgeon U. S. A.

Ft. Gibson, Indian Ter., June 6, 1884

It is possible, however, that the letter was referred from one office to another until at last it attracted some official notice in the War Department, and may have indirectly resulted in the promulgation of the following order, which must prove of considerable value to the Army in the near future:

ADJUTANT-GENERAL'S OFFICE, Washington, Nev. 20, 1880. No. 86.

The Secretary of War being of opinion that instruction by lecture or demonstration in the simpler practice of medicine and surgery may with advantage to all comberned be given by officers of the Medical Department stationed at military posts to other officers and the enlisted men serving thereat, directs that, whenever practicable and where voluntary attendance in sufficient numbers can be secured, arrangements be made for a series of such lectures on the practical treatment of the unhidden diseases, early aid to the injured, the most expeditious and proper manner of treating temporarily gunshot wounds, poisoned wounds, frostbite, bruises, dislocations, laemorrhage, and tractures of bones; application of the tourniquet; the most approved method for resuscitation from drowning; and other kindred subjects.

Medical officers delivering these lectures will forward, not later than June 30, 1887, through the regular military channels, to this office, a report of the results, beneficial or otherwise, which may have attended them up to that date.

By command of Lieutenant-General Sheridan:

R. C. DRUM, Adjutant-General.

Whatever the fate of my communication to the for me to see that our military authorities are gradu-

REMARKS ON CATARACT EXTRACTION.

Read before the Medical Society of the District of Columbia, Feb. 23, 1887.

BY SWAN M. BURNETT, M.D.,

PROPESSOR OF OPHITHALMOLOGY AND OFOLOGY IN THE UNIVERSITY OF GEORGETOWN; OPILITALANIC AND AURAL SCRERON TO THE GAR FIELD HOSPITAL; DIRECTOR OF THE OFILITIALMIC AND AURAL CLINIC AT THE CENTRAL DISPENSARY AND EMERGENCY HOSPITAL, WASH-INGTON, D. C.

Since the opening of the Garfield Memorial Hospital about two years ago, I have made twenty-five extractions of senile cataract. The number is not large, but the cases have been of such a character as will very properly serve as a basis for a few remarks on some of the mooted questions concerning this most important surgical operation.

The extraction in every case was effected through an upward incision in the cornea, made in accordance with the plan of De Wecker; that is, the upper third of the cornea was detached from the sclerotic, the incision lying wholly in the transparent tissue. Sometimes a flap of less magnitude was formed by the apex of the incision lying farther from the scleral border than the base, but this was only exceptional, and experience shows that it has no essential advantages over the incision as perfected by De Wecker and now very largely adopted by operators who have not originated some special plan of their own. In no case was the incision placed so peripherally as in the method introduced by Von Gräfe.

This incision of De Wecker seems to steer us as safely through the straits between the Scylla of corneal suppuration, and the Charybdis of iritis and cyclitis as could be reasonably hoped for. It gives an opening sufficiently large for the easy delivery of even the largest nucleus, and the lips of the wound adapt themselves as perfectly and with as little danger of gaping as in the so-called linear incision of Grafe. This in-

The books I have mentioned will give more in- cision offers yet additional advantages over the Gräfe by me. The English books especially are of the without an iridectomy. It seems therefore, that as regular and volunteer army who are about to carry cerned, it is hardly possible for us to go farther to-

In ten of the cases the extraction was made without usefulness. The subject is of national importance, an iridectomy. This method, practiced largely, indeed almost without exception by the French, is struggling for a foothold in this country, with howorganizing for such an important movement in the ever, I believe but only a moderate chance for immediate adoption. Certainly an eye with a central movable pupil is on all accounts to be preferred to one with a large colohoma in the iris, but it is equally certain that even in the hands of the most skillful this is not to be attained in all cases in operating without an iridectomy. In a rather large minority there will be prolapse of the iris. It is an operation demanding rather more skill in its performance and requiring more quiet and repose on the part of the patient for the first forty-eight hours after the operation than with an iridectomy. And yet it is an operation that I think should be cultivated, because I believe we shall in time be able to master most of its disadvantages. I attempt it in every case in which there is no marked increase in the tension of the eye-ball, and when the anterior chamber is reasonably deep. Under these conditions, with a moderately docile patient, I do not greatly fear a prolapsus of the iris. And, moreover, should the iris refuse to return after the delivery of the lens, with a moderate amount of coaxing, it is as easy to make excision of the iris after as before the exit of the lens, thus converting it into an ordinary extraction with an iridectomy. I do not find that delivery of the lens is any more difficult than with iridectomy, and I believe the danger of prolapse of the vitreous is less, since there is not so great a liability to rupture of the zonula.

> The possibility, however, of prolapse of the iris after it has been once returned cannot always be guarded against, even by the use of eserine. Here eveything depends upon the accurate cooperation of the wound, and an early and persistent adhesion of A perfectly proper incision is therefore one of the first requisites for success in this method. This comes of skill and experience; but the second requisite-perfect rest of the eye for forty-eight hours—can never be coun'ed on; for even the quietest patient, during sleep may make a sudden movement of the eye which will open the wound, when the aqueous humor will gush out, carrying with it the iris which remains thereafter fixed in the wound.

> In two cases extraction was made with the lens in its capsule. In these cases an iridectomy was first made, since extraction in the capsule is much easier thus than with the iris entire. In both cases the result was perfect, and there was no escape of vitreous following the exit of the lens. In one instance it was done on account of a thickened and tough capsule: the other case was one of "black" cataract and it was desirable, for the purposes of investigation, to remove the lens in the capsule.1

A detailed history of this case and a consideration of the subject of black cataracts and their diagnosis is to be found in a clinical fecture published in the Medical News, Jan 29 1887.

In one instance only was a preliminary iridectomy made. This method, which has been brought again it was attempted to return the prolapsed iris by rubto the notice of the profession of late years, princibing the upper lid gently over the incision, but where pally through Förster, of Breslau, has something to that was not sufficient a small Bowman's probe, diprecommend it in a certain class of cases of which ped in the antiseptic solution was used to reposit the ours is typical. tism could not be obtained. The months of onset tributed among the twelve months of the year as were, therefore, taken and compared with the follows: monthly average of the weather, this, although rendering the result less accurate will, however, show many points of interest, the study extending over

the decade 1876-1885 inclusive.

The months of onset of 437 separate attacks of chorea were taken from the books of the Orthopædic Hospital and Infirmary for Nervous Diseases during this decade; and attention is drawn to the fact that it is the time of onset of the disease that is noted and not the time of application for treatment; any conclusion drawn from the latter method of notation must necessarily be inaccurate. As it is a wellrecognized fact that a relationship exists between chorea and rheumatism, which it is needless to say, is as yet imperfectly understood, I thought it would follows: be of interest to compare with the cases of chorea the months of onset of attacks of acute and inflammatory rheumatism, and for this purpose studied the notes taken at the Pennsylvania Hospital, which were placed at my disposal; from these were collected 467 separate attacks of acute rheumatism which occurred during the years in question, all cases being excluded that were at all doubtful, together with those that did not originate in this city: this, of necessity, excludes nearly all the cases occurring among sailors.

To compare neuralgia with these two affections, I have extracted from the article by Captain Catlin, on Mitchell), the hours of pain per month for the period weather by Captain Catlin, previously mentioned. of his study, of his own case, from 1875 to 1882 in clusive; but, unfortunately, Captain Catlin was situ- ing January 1, 1883, was 12,994 hours, or nearly oneated at West Point, and the years of study do not fifth of the time. coincide, and, therefore, for a better comparison I

have been expunged, this then includes a period of seven years, 1876-82 inclusive, in which the two studies coincide, except for locality.

The weather statistics were compiled from the records kept at the Signal office in this city, and consist of a study of the temperature, range of the thermometer, barometer, relative humidity, amount of rain and snow in inches, number of cloudy and I have been requested by your committee on rainy days, and the number of storm centres (centres meteorology and epidemics to read a paper on the of low barometer) passing within circles of varying

To compare the relative frequency of neuralgia "The Relation of Pain to Weather" (read before the per month with these records, I have had recourse College of Physicians in June, 1883, by Dr. S. Weir to the unique study of the relation of pain to

The total amount of pain for the eight years end-

The winter months hold the advantage as pain have prepared a table in which the first year of the producers, and for this period, while the sun was neuralgia record (viz., 1875) and the last three of my north of the equator, there were 6783 hours, against records of chorea and rheumatism (viz., 1883-84-85) [6161 hours while it was south of the equator.

The hours of pain were distributed among the twelve months as follows:

94 per cent. January, 1220 hours = February, 8.3 1084 =March, 1234 =9.4 April, 1062 8. 1 May, $\tau \circ S_0$ 8.3 June, 7.2 947 July, 007 7.6 August, 8.2 1000 = September, 1000 = $7 \cdot 7$ October, 1038 =7.9 8.4 ٠. November, 1104 = December, 1153 8.8

the number per month is seen; the two highest ary, immediately followed by a rise to the highest months for chorea being May and March respection tin March, after which there is an irregular fall tively, and the two lowest being October and No until the low point in August is reached. The total vember; while for rheumatism, the two highest are number of storms passing within this circle for the January and April, and the two lowest November ten years in question, is 520, and they are distributed and August.

The highest month for rheumatism follows the highest month for chorea, instead of preceding it, as we might have been led to suppose from our knowledge of the relationship between these two affections, although a considerable rise is seen in the number of attacks of rheumatism in January, two months before the greatest rise in the number of! chorea cases.

The greatest suffering from neuralgia occurred in March, and the least in June. An attempt to explain these variations, naturally brings us to a study of the varying conditions of the weather.

Nothing especial is seen in comparing with the chorea tracing (tabulated from the foregoing figures) that of the mean relative humidity, (and by this is figures with that of chorea, must be struck by the meant, not the *mean actual amount* of moisture contained in the air, but the *mean per cent*, of the moisture that could be held in suspension at the mean temperature of each month) or that of the mean to keep pace, month by month, with the irregularities barometer, except that there appears to be an in-1 of the storm tracing, that of rheumatism, while also crease in the number of attacks of chorea with a strongly resembling the latter in its general characfall in these two tracings; the reason for this will aptiteristics, may be seen to be almost exactly one month pear later; neither is much learned by comparing *later*, looking as if the effect of the meteorological the chorea tracing with that of the mean daily range changes was immediate in the case of chorea (as will of the thermometer, which shows the variableness of be seen later to be the case with neuralgia), and the different months; this is greatest in May, and preparatory only in the case of rheumatism. A least in December. The mean temperature tracing marked resemblance exists between a tracing made which is highest in July and lowest in January, does from the hours of pain per month previously mennot throw much light upon the subject. When, tioned, and the storm tracings, even when the years however, the tracings of the number of the cloudy of study do not coincide; when, however, a table is days, and the days on which rain or snow fell, and prepared for the years 1876-82 inclusive, during the amount of rain, or melted snow in inches, are which the studies do coincide, the great resemblance studied, a slight resemblance to the chorea tracing becomes manifest; this is most marked with the begins to be apparent, and the probable cause of 700 mile, and less marked with the 400-mile tracing, this becomes more evident when the storm tracings although still pronounced. are studied, because these meteorological factors. It would be interesting to know how many nervmay be considered as component parts of a storm, ous disorders are thus immediately influenced by the The cause of the relationship previously noted as weather, and in how many others are the meteoroexisting between the chorea, and the mean relative logical changes to be looked upon as preparatory to humidity and mean barometer tracings, now becomes the outbreak of the disorder. The hot weather of clearer, the storm centres being centres of low bar- July has been shown to precede the month of onset ometer.

In studying the storms, circles of varying radii were drawn around Philadelphia as a centre, and the number of storms, as marked on the weather bureau maps, counted in each.

The storms passing within the 400- and the 700mile circles are the only ones I will discuss; the former because it shows the nearest resemblance to the chorea tracing, and the latter, because the average distance over which a storm can influence neuralgia has been found by Captain Catlin to be about 700 miles. A very strong resemblance exists between these two storm tracings.

The smallest number of storms passing within the 400 mile circle occurs in August; a rapid rise of the tracing then takes place, until December and Janu-In glancing over these figures, great variation in ary are reached, then there is a slight fall in Februas follows:

Effectual Disinfection of Uterine Tents. and many other affections might open up much that Dr. DIRNER, of Buda Pesth, has recently written in the Centralblatt für Gynakologie on the effectual disinfection of tents used for gynæcological purposes. He observes how, after the greatest precautions, serious pelvic inflammation may follow the introduction of sponge or laminaria tents. This accident is clearly due, not to the mere ulceration of the dilated structures, but to the introduction of septic material through the wounded mucous surface. The preparation of tents by soaking or coating in antiseptic media is insufficient. Septic matter may be introduced with the aseptic tent; surgeons handle and throw about samples at the shops, nor is the process of manufacture always properly superintended. Fritsch's method of coating tents with wax requires warm water to be at hand when the wax has to be melted, and that water may be septic. Dr. Dirner has detected cracks in the wax, allowing the admission of dust. The most carefully prepared dry tents can convey septic germs on their surfaces. For a year Dr. Dirner has employed in Professor Tauffer's wards a special system of disinfecting laminaria tents. He immerses them in a 1 per cent. solution of corrosive sublimate in absolute alcohol contained in a wide-mouthed bottle, When required, a tent is taken straight out of the solution and passed into the canal of the cervix, the patient being previously placed in admirable, and he has seen no bad effects follow the absolute alcohol be employed, the expansive power of the laminaria is in no way damaged.—British

BACTERIA IN ICE.

emy of Medicine, in March, Dr. T. MITCHELL PRUD- there may be a precipitation amounting to as much DEN read a paper of great interest, denoting more as 90 per cent. The effect of freezing on water conoriginal research than any contribution to the Acad- taining bacteria was comparable, he said, to that of emy for some time past, on "Bacteria in Ice, and filtration, but with this vital difference, that whereas their Relations to the Ice Supply of New York City by filtration all forms of bacteria are removed in ap--an Experimental Study." His object in the series proximately equal ratio, by freezing, which acts as a of investigations was to give by experimental means sort of selective filtration, some of the most dangerdefiniteness and precision both to the problem in ous forms may be retained while others are destroyed. general, and to the detailed questions which arise in connection with the ice supply of one particular town. rived from a series of naturally excellent lakes and erable certainty just what series of questions are to far the most important source. The Hudson River be answered, and what investigations are to be made, ice is obtained between Troy and Poughkeepsie, and in order to decide upon the safety of any given source in the upper portion of this region the stream receives clear light which new methods of science throw upon. Here, then, is a great tidal river rich in sewage polspeedily be brought about.

termine whether the water or ice is fit for use. The bacteria by sedimentation. popular impression that water purifies itself in freezing extensive, or even largely made up by the more river ice than in that from the other sources, while in

hardy species, the ice formed from it, even though quite transparent, may still contain large numbers of the living germs. The experiments showed that baeteria of different species possess different degrees of vulnerability to the action of low temperatures. Certain species which are capable of producing serious and even fatal diseases in man—the bacillus of typhoid fever and the common bacillus of suppuration, for example—are capable of resisting a prolonged low temperature, with the destruction of only a part of the individuals thus exposed. In the case of the typhoid fever germ the exposure was for seventy-seven days. The resisting capacity of the different species was found to vary with the vitality of the individuals, the degree of temperature, and the time of exposure; while alternate freezings and thawings sufficed to entirely exterminate in a short time all species experimented on, even those which can endure for long periods a sustained low temperature. The data gathered seem to justify Dr. Prudden in At the last stated meeting of the New York Acad- the conclusion that in the freezing of natural waters

The ice supply of New York City is principally de-His valuable studies enable us to know now with tol- tanks and from the Hudson River; the latter being by of ice supply. These detailed investigations, how- the entire sewage of Troy and Albany, to say nothing ever, as he said, can only be made under the sanc- of that of many smaller places, and the contamination and direction of the public authorities. In the tions brought from the west by the Mohawk River. the whole subject of ice impurities, it seems neces- lution; but, while the conditions in the upper Hudsary that a sweeping reform, in some respects, should son during the ice-forming season scarcely seem to be such as would favor purification from organic Even after we have determined the number of bae- matter by oxidation, they do seem to be theoretically, teria present in water or ice, a careful consideration and are shown to be practically, favorable to a conof other conditions is still imperative, in order to de-siderable degree of spontaneous purification from

In regard to the actual analysis of the ice brought is only partly true, so far as the bacteria are concerned. from the Hudson, and from the lakes and ponds re-The partial purification from bacteria is accomplished, ferred to, it was found that there is a much greater not by their expulsion from the water, but by the number of bacteria in the snow ice than in clear ice, death of a certain proportion of their number, so or that moderately full of bubbles. The species of that, if the bacterial contamination of the water be bacteria are much more varied and abundant in the tively harmless water bacteria. While the number were present in considerable numbers, in its mixture of living bacteria varies greatly, not only in different with other species and in the large dilution which parts of the same block of ice, but also in ice from exists, is a matter attended with very great practical different parts of the river and from different lakes difficulties. As is well known, it has been found in and ponds, the average number is considerably water suspected to be the cause of certain local greater in ice from the river than from the lakes and outbreaks of typhoid; but here the conditions for its ponds; even when Albany ice, which is the worst of discovery in such instances are much more favorable. all, was excluded from the estimate. It was found, It is certain that this ice is not so important a factor also, that the average number of bacteria in ice from in the transmission of the disease as to render the all sources taken together was far beyond the gen- typhoid fever statistics worse than those of other eral standards which even a moderate degree of pur- places whose residents use cleaner ice; but, at the ity would allow. As regards the lakes and ponds we may conclude that, although the ice from some of them contains a larger number of living bacteria than is consistent with the highest hygienic standards, the conditions can be readily changed so as to render this ice unimpeachable. With Hudson River ice, however, the case is very different; and it is a pertinent question as to what actual danger is to be feared from its use for drinking purposes. A considerable number of the bacteria which it contains are undoubtedly the relatively or absolutely harmless species, which may exist in any natural river or spring water; but a large number may, with equal certainty, be assumed to originate from animal excreta. again, it is scarcely to be doubted that a considerable proportion of the bacteria existing in sewage and coming from human and other excreta, and the various putrefying fluids which form a prominent ingredient in the water of populous towns, may not be positively dangerous if taken into the body in moderate quantities.

There are some varieties of diarrhœal disturbance, severe or mild, which often seem to depend upon impure water or ice; but whether they are occasioned by sewage or other bacteria, or by organic matter, or by both, is not yet certain; and this class of cases may be left out of view. Cholera and anthrax, both bac- Hudson or other large rivers. Here it would be terial diseases, transmissible by drinking water, are necessary to establish, by a most thorough scientific not ordinarily present in the sewage of the region examination, the distances from all sources of sewage under consideration; and these diseases, though they pollution at which it might be safely assumed that the cannot be ignored by those having the public health; water had sufficiently freed itself from the bacterial in charge, may also be left out of view. But there and other impurities to form safe ice. It might in are many common and very important bacterial affec- this way be possible to remove any chance of danger tions, almost constantly present in large towns, like by permitting the questionable or bad ice to be sold Albany, and frequent enough in the smaller ones, viz.: only for cooking purposes, if such a classification typhoid fever and the trouble associated with acute were practicable, and thus not materially interfere suppuration and the so-called blood-poisoning from with the interests of the ice companies. A comwounds, and pyaemia. As to the probable danger pulsory system of disinfection of excreta in infecfrom typhoid fever to which persons using Hudson tious diseases should be instituted, as has been done River ice are exposed, it is impossible to determine in other countries in which the purity of the water at present. The typhoid bacillus was not detected supply is under constant supervision.

both there is a considerable proportion of the rela- in Hudson River ice; but to do this, even though it same time, there are many cases of typhoid fever in which the most rigid examination of the sanitary surroundings of the patients and their personal contacts entirely fails to account for the origin of the disease; and some of them may well be cases of ice-poisoning from the typhoid bacillus. With the bacteria of suppuration and pyæmia the case seems much less serious, because of the very general antiseptic treatment of wounds now in vogue; but the fact that the staphylococcus pyogones may be in ice in a living condition is one that should not be lost sight of.

> The measures which may be adopted to guard against this not only possible, but very probable, source of danger are of two kinds: first, such as come under the supervision of health officers; and second, those belonging to the province of the con-In the first place, it would seem necessary that the State Board of Health, or some other authorized body, should be placed in charge of the iceharvesting fields, and, by a system of inspection not less strict than that which should exist in the case of the ordinary water supply, determine which, if any, of the sources of ice supply are so situated as to imperil the health of ice consumers. of Dr. Prudden's investigations, this appears to be comparatively simple in all cases except that of the

THE PATHOLOGY OF PUERPERAL CONVULSIONS.

In regard to our editorial article on the "Treatment of Puerperal Convulsions," in The Journal. of March 12, Dr. F. Walton Todd, of Stockton, Cal., writes:

"I do dot think that a misleading expression (me judice) in your editorial of the March 12th number, on the "Treatment of Puerperal Convulsions" should go unchallenged. You say: 'We need not stop here to discuss the pathology of puerperal convul sions.' In that lies the success or failure of our treatment of this frightful disease. That some cases are apoplectic while others are epileptic is clearly manifest from treatment, and abundantly attested by leading obstetricians of our own and foreign coun- of the history of the pathology of puerperal convultries; and he who relies upon the hypodermic injection of morphine, on chloroform, chloral, veratrum viride, or the bromides in the apoplectic form will be doomed to disappointment; and he who relies upon the lancet in the epileptic will equally fail of a happy result.

"I will give two typical cases: Mrs. Dr. P. was delivered of a child, her first, at midnight. A few minutes afterwards she became convulsed, the paroxysms returning every half hour, and continuing all liver and yellow fever: if the patient gets well it is night and all the next day until 8 P.M. During this time eight of the leading physicians of our city had atrophy of the liver. Still again, admitting some became calm, and had no further convulsions. Mrs. McL. within two weeks of her confinement at full term gave evidence of albuminuria. She had was, that a discussion of the pathology of puerperal taken pulv. jalap com., digitalis, and such other convulsions would have taken us beyond the limits latter part of labor, and as soon as they appeared I epileptic. gave her a hypodermic injection of morphia and atropia, and repeated it several times, together with chloroform and the bromides, with the same results as in the former case. The first case was apoplectic, and in the opinion of every one of the medical men ery." Such is the apparently serious exclamation in present would have died without the bleeding; the a recent editorial in one of our valuable exchanges.

second was epileptiform, and would, I think, have been injured by venesection."

We must take issue with our correspondent on several points. We are aware that Dewees taught that puerperal convulsions were epileptic, apoplectic, or hysterical, and Meigs and Hodge respectively referred the convulsions to the determination of blood to the head, and to a corgestion of the cerebral vessels or an actual effusion of blood or serum into the substance or cavities of the brain; but to show how these theories are regarded by "leading obstetricians of our own and foreign countries" it is sufficient to say that they are not mentioned by Barnes, Galabin, Zweifel (whose work has just appeared), or Lusk; Parvin mentions them as a part Indeed, when the editorial article in question was written those theories did not once occur to us. Again, admitting such pathology of the affection, a discussion of it would be futile if it "is clearly manifest from treatment." If it is not manifest before treatment is begun it is certainly of no particular value as regards treatment. A differential diagnosis based on treatment in such a case is very much like that once given between acute yellow atrophy of the yellow fever; if he dies it is probably acute yellow seen her, and upon the suggestions of one and another cases as apoplectic, there is a great deal of mystery she had taken morphia by the mouth and hypoder-surrounding the sudden recovery after venesection. mically, chloroform, chloral and bromides, but the Apoplexy does occur sometimes during labor, but convulsions were unchecked, either in frequency or the symptoms are not those of puerperal convulsions, violence. WHAT IS A BANQUET?

"A banquet without wine would be a hollow mock-

desirable on such occasions.

"banquet a hollow mockery." But is there really any the banqueting table, or in any other relation of life. truth in the assertion that, "A banquet without wine would be a hollow mockery?" Is it true that banqueting simply means wine drinking, or that a banquet and a debauch are necessarily synonymous? The most authoritative lexicographer, using the English language, gives no less than six definitions or uses of the word banquet. Three of them make it indicate a bench, a three-legged stool, or a bridge or sidewalk, and the other three define it to be "a feast, a rich entertainment," etc., and illustrate it by quoting lines from Dryden, Coleridge, Milton, and the following from Evelyn: "There were all the dainties, not only of the season, but of what art could add, venison, plain solid meat, fowl, baked and boiled meat, banquet in exceeding plenty, and exquisitely dressed." But in none of them is there a single mention of wine or any other alcoholic drink. Poor indeed would be the civilized community that could not furnish from the dainties of the season, the varieties of fish, fowl, and solid meats, etc., exquisitely dressed and decorated by art sufficient for a "banquet of exceeding plenty," without wine. And still poorer must be the human mind that cannot rise ment without the prompting of the wine-cup.

We are not now alluding either to temperance or intemperance, but to the absurdity of claiming that a banquet cannot be abundantly rich, varied, and luxu- to be indulgence in free exercise, such as walking rious, and accompanied by the most brilliant display and open air life. of wit, social repartee and eloquence, without either wine or other alcoholic beverage. Some of the richest and most enjoyable banquets we have ever attended, had neither a wine-glass nor a bottle in the annual meeting for examination of candidates for room. The Temperance Breakfast, spread in the licenses to practice medicine, will be held by the banqueting room of the Royal Pavilion during the Illinois State Board of Health, at the Grand Pacific last meeting of the British Medical Association in Hotel, Chicago, on Thursday, April 21.

The author of it was very properly deprecating the Brighton, was one of the most enjoyable feasts of the evil influence of the example of providing wine or week. At the regular Annual Banquet of the Assoalcoholic drink for banquets at annual meetings of ciation during the same week, every member taking State or other Medical Societies, and yet claiming his ticket for the banquet exercised full liberty to that some kind of entertainment or social reunion is choose wine or no wine and paid the price accordlingly. The richest and most enjoyable banquet ever The same mental embarrassment that troubles our partaken of by the members of the Illinois State editorial confrère, has troubled in times past, and is Medical Society was during the last meeting in this still troubling the minds of many thousands of good city, only a few years since, in the spacious dining people, who dread the terrible dangers of the lur- room of the Grand Pacific Hotel, without so much ing wine-cup in the family, in the social circle, and as a cup of either fermented or distilled drinks. The on the banqueting table; and yet they seem puzzled time has fully come when every man and woman who to know how to be social or hospitable without it; or desires neither to drink wine themselves nor to furmore correctly speaking, they are greatly oppressed nish it to others, should exercise the right of choice with the fear that if the wine is omitted, some, at with just as much freedom, as those who desire to least, of those they desire to entertain will regard their drink, whether in the family, the social circle, around

THEISM-THE NEW NERVOUS DISEASE.

Attention has recently been drawn to a new nervous disorder said to be especially prevalent in England and America; it is called "Theism" or teadrinker's disease. It is said to exist in three stages -the acute, subacute, and chronic. At first the symptoms are congestion of the cephalic vessels, cerebral excitement, and animation of the face. These physiological effects being constantly provoked, give rise, after a while, to reaction marked by mental and bodily depression. The tea drinker becomes impressionable and nervous, pale, subject to cardiac troubles, and seeks relief from these symptoms in a further indulgence in the favorite beverage, which for a time restores to a sense of well-being. These symptoms characterize the first two stages. In chronic cases theism is characterized by a grave alteration of the functions of the heart, and of the vasomotors, and by a disturbance of nutrition. The patient becomes subject to hallucinations, "nightmares" and nervous trembling. With those who take plenty to the higher plane of social and intellectual enjoy- of exercise, an habitual consumption often may be indulged in with impunity, but with women and young people who follow sedentary occupations this is not the case. The best treatment for theism is said

Stated Meeting, February 23, 1887. THE PRESIDENT IN THE CHAIR.

OSTEO-SARCOMA OF THE FEMUR.

The following is the history of the case: Mrs. X., aged 60, white, fell August, 1886, and fractured the right thigh about the middle. She was treated in the usual way by Dr. Sothoron. About seven weeks ago Dr. Thompson first saw her. He found non-showed but little evidence of shock. union of the femur and stated that the only way to cure her was by an operation. After seeing her once many thicknesses of bichloride of mercury gauze, or twice subsequently, however, he concluded that kept in place by a spica of the groin. The thigh of

The woman was beginning to have pain and she was obliged to give up the use of crutches with which she had been going about. The thigh increased in size. Amputation seemed the only recourse, but upon consultation with Dr. Lincoln it was decided to delay a little longer, and the leg was put up with a slight amount of extension in order to keep it quiet. The pain, however, increased to such an extent that it was impossible to afford relief, and upon further consultation with Dr. Lincoln amputation was decided upon. Dr. Thompson stated that he fully appreciated the gravity of the operation, and while he felt himself justified in performing it, he was th the following history of the case:

Miss B., single, age 29, white, was sent to me by die on the table. This morning, (February 23,) with Dr. H. E. Leach, of South Washington, last Decemthe assistance of Drs. Sothoron, S. W. Bogan, G. W. Johnson, Sprigg and Cutts, the operation was perrecognized by Dr. Leach as an ovarian tumor formed, the full consent of the patient and her friends

Dr. Thompson said that while he was certain that an adult head, and gave her scarcely any trouble, I the best hope of permanent relief was in removing recommended its removal as soon as she could arthe leg at the hip, he had determined to make the flaps so that he might save as much of the femur as I performed the operation on February 5, in a he possibly could, if he found that advisable. Havand by its abnormal condition it, with its Fallopian terior flap were made, both by cutting from outside tube, was unmoved also. The patient is now in her inwards. The femur having been reached it was thirteenth day since the operation, perfectly comfort- sawn through just below the lesser trochanter. At able, with normal pulse and temperature, and so far the first cut of the saw it broke into fragments. as I can see an unclouded prospect for perfect re- Finding that the bone was diseased, the head of the femur was dissected out from the acetabulum. Ow-A section of the unbroken cyst reveals it full of ing to the great thickness of the flaps, free drainage and a smaller one externally at the most dependent portion of the wound. The flaps were then united by four concealed catgut sutures into the mass of the muscles, several interrupted silk sutures in the usual way, and finally an uninterrupted catgut suture Dr. J. Ford Thompson presented a specimen of the whole length of the wound, thus closely and securely fixing the parts in apposition. The wound was then washed out with a warm, weak solution of carbolic acid, and the drainage tubes were found to communicate. Irrigation with hot water was kept up during the operation. The patient stood the operation very well, and when she was put to bed

The dressing was of iodoform gauze followed by there was probably malignant disease of the bone. the amputated leg is about twice as large as the

Suppuration followed without any apparent ical, lobulated, encapsuled, medullary tumor, five reason. Six months previously the same patient inches in diameter; the portion of bone remaining above the tumor as well as its medulla, is very vascular; and the muscles adjacent to the tumor, pale from fatty degeneration. The tumor probable originated in the medulla and in growing, produced the who use antiseptics have about abandoned the idea fracture mentioned in the history of the case.

The committee on Microscopy report as follows: This tumor is a spindle celled sarcoma with some giant cells. The softness of the growth is due to connective tissue.

DR. SWAN M. BURNETT read a paper entitled

REMARKS ON CATARACT EXTRACTION.

(See page 401.)

Dr. J. Ford Thompson said that he was a firm believer in antiseptic surgery, and he did not think that any good would accrue to that system if it had to rest upon the results obtained in ophthalmic or abdominal surgery. Dr. Burnett deserved credit for his effort to carry out antisepsis in his work on the eye, but it is probable that he can only approximately reach a perfect antiseptic dressing in that region. Distilled water might just as well be used as a weak solution of some antiseptic used merely to wash over the surface of a part. The same obtains in regard to abdominal surgery. Men who do not employ antiseptics in this field use their successes against Listerism. The peritoneum will not permit a very useful solution to be used upon it, and at any rate, that is only one branch of the wide domain of antiseptics. Lister himself says that the results obtained in abdominal surgery are not a criterion by which to judge of the value of antiseptics.

Dr. Burnert said that he was interested in the discussion of the value of antiseptics both as a pathologist and a physician, for it opens up the question of the etiology of suppuration. Is there a microbe

other. Below the knee the legs are of the same of suppuration? If so and we can find something size. About the middle third of the thigh, can be with which to throttle it, then we have accomplished plainly felt a tumor as large as an infant's head, a great end. He cannot agree with Dr. Thompson The incision which is seen through this tumor shows that the eye is not a good field for the use of antiit to be an encapsulated mass in appearance, and of septics. We have here more or less control of the a consistency but little harder than the brain. Sev parts. We can make it a closed cavity by shutting eral nodules, also encapsulated, project from it. the lids, and this is most favorable to healing without The tumor appears to be nearly spherical in shape suppuration. It is also, constantly bathed by a and about five and one half inches in diameter. It bland if not strictly an antiseptic fluid. It seems that we have not reached has been absorbed for about four inches, while the the final cause of suppuration. Either there is some rest of it, both above and below is practically a other external factor beside the microbe or we have

There must be some condition of health or idiosyncutaneous adipose tissue. The capsule strips read-crasy of the patient which makes them susceptible ily from the tumor and shows no sign of ossification to this process. In all his cases in which suppuration occurred, the patients were in a low state of The specimen consists of the lower three-fourths health. In one case a most perfect operation was who was in better health was operated upon with complete success.

Dr. Thompson thought that Dr. Burnett expects too much from the use of antisepties. The surgeons that antiseptic dressings will prevent suppuration. Union without suppuration is obtained even where no antiseptics have been used.

The microbe of suppuration is not the important granular and fatty degeneration and the scarcity of element, but the microbe of putrefaction. This last we do not yet know enough about. A deep seated abscess is not accompanied by a microbe of suppuration. It is a death of cells, and nature takes this way to rid herself of effete material. The pus is either absorbed or finds an exit for itself. When the pus reaches the surface of the body the trouble. begins, for then it is that the air is admitted and with it the germ of putrefaction. The object of the antiseptic dressing is to shut out this germ, to keep the wound aseptic. In the cases referred to by Dr. Burnett, the patients were in bad health, which, as he says, probably had much to do with the complication. Moreover, in the eye, suppuration is a much more serious process than in other parts, and is of itself sufficient to destroy the organ without the complication of putrescence. Suppuration in the abdominal cavity is also as harmful as it is in the eye, so from the results in these two classes of cases the value of antiseptics in general surgery cannot be obtained. Of course, it is desirable to prevent suppuration if we can, but he does not believe that this end will ever be attained.

Dr. C. E. Hagner thought that Dr. Burnett struck the keynote when he spoke of the condition or idiosyncrasy of the patient as an etiological factor of the process of suppuration. Persons with a scrofulous diathesis, and so far as his observation goes, light haired and fair skinned persons are especially liable to suppuration. Landable pus, however, is

ST. LOUIS MEDICAL SOCIETY.

Stated Meeting, March 5, 1887.

Dr. E. H. Gregory presented

A FIBROID TUMOR,

removed a week before, including the uterus. He first saw the woman from whom it was taken about one year ago. She had then been a sufferer for three years. It was a tumor that reached nearly to the umbilious, and he was satisfied that it involved the nterus. She lost a good deal of blood and was treated with ergot. For two months before its removal she had not lost much blood, but there was almost a constant reddish leucorrheea, and she was very pale. She suffered very little, nor was any function especially encroached upon. She was advised to let it alone, and the advice was repeated when she came again to have it operated upon. He told her that she was within a few years of a period when certain natural changes take place in the organ in the direction of atrophy. She was 35 years of age, and, feeling that there was much danger and uncertainty, he advised her to let it alone. But he felt sure that some younger, more enterprising surgeon might advise her to have it removed, and she seemed determined to have it done. It was therefore removed last Saturday. On opening the abdomen, carrying the incision beyond the umbilicus, he easily tilted this tumor out, put a clamp

not especially harmful. This we see in cases of of 100 on Monday, but there was no peritonitis and

Dr. Chas. Stevens wished to know whether, as a general thing, one would expect recovery after a

Dr. Gregory said that in the large majority of cases, one would expect recovery. He removed one a year ago, and the woman recovered-"without a bad symptom." He did not use any drainage, because there was nothing to drain.

Dr. F. Lurz said that those who had paid atten-Dr. Burnerr replied that the ancesthetic used in tion to this subject think there is a well-founded opinion concerning the natural growth of a fibroma of the uterus; and in many instances, the question is, whether the patient ought to be operated on at a certain period of life; whether the nourishment of the fibroma does not cease at the time of the climacteric period. Keith lays special stress on the fact that in many cases a tumor which heretofore has been troublesome, when the climacteric is reached ceases both THE PRESIDENT, S. POLLAK, M.D., IN THE CHAIR. to be troublesome and to grow, on account of the diminished nutrition, on account of the change going on in the genital organs. Dr. Lutz has now under observation a woman whom he has been treating for more than a year, with a fibroma of the uterus. At first the hæmorrhages which occurred seemed to be due to the fact that she was in the climacteric period, occurring every two or three weeks. He thought she had an intra mural fibroid, and the question of interference came up. He succeeded in converting the gentleman who attended with him to the opinion that possibly this fibroid would be less troublesome after the period had passed, and that the symptoms were not sufficiently urgent to demand immediate operative interference, so he put off the operation, and he believes, rightly, as for the last four months there has been but little hæmorrhage, and the tumor has given her but little trouble. The patient is 43 years of age.

Stated Meeting, March 12, 1887.

THE PRESIDENT, S. POLLAK, M.D., IN THE CHAIR.

Dr. H. H. MUDD made some remarks on

COLIES' FRACTURE.

Last fall he presented a patient who had a Colles' opposite the internal os, was very careful to exclude fracture; accompanying the fracture there was an the intestines and more particularly the bladder, be- extensive teno synovitis with stiffening of the parts cause in these cases it sometimes reaches high up, around the joint. His reasons for again bringing up and it was excluded with some difficulty. Tait's this subject may be found in a portion of the report clamp was used. After making the clamp fast on of the discussion of the meeting held June 12, 1886, the bladder side, he was equally careful in making as follows: Dr. Gregory had not abandoned the old it fast on the hinder portion, and the uterus was then pistol-shaped splint and had heard no good argument cut off and shelled out. The woman died. The to prove that such a splint invited subsequent derule is that they get well, and without a bad symp-formity. He thought deformity almost absolutely tom. His patient died without a good symptom, certain in every fracture, -sometimes, of course, so He thought it well to have this sort of a thing placed slight as not to be apparent. Bones did not unite opposite the numerous recoveries. She lived until without scarring at the side of fracture, and there is Thursday. On Tuesday it was thought she was no such thing as scar tissue without departure from about to get well, but there was never a reaction the original. GYNÆCOLOGICAL SOCIETY OF BOSTON.

Stated Meeting. December 19, 1886.

THE PRESIDENT, H. O. MARCY, M.D., IN THE CHAIR. H. J. Harriman, M.D., Secretary.

Dr. E. C. Keller exhibited an

OVARIAN CYST,

removed by her at the New England Hospital for Women, with the following history: Patient 32 years old; widow. Tumor of two years' growth. Had been tapped some months since, and again about three weeks prior to the operation. Had always had much pain and had not been able to lie down since February, 1886; heart displaced and pulse 120; weight before operation 126 pounds. the operation the tumor was found bound down by adhesions to the omentum, stomach and intestines. The adhesions were not recent. The opening into the cyst resulting from the last tapping had not closed, and the ovarian fluid had leaked into the peritoneal cavity. The tumor was multilocular, and one of the sacs contained a very dark fluid, almost black. Bleeding from small vessels torn while breaking down the adhesions was so troublesome that twenty ligatures were applied, and as they did not check the hæmorrhage, two gallons of water at a temperature of 118° F. were poured into the abdominal cavity. Even this was not entirely successful, and Monsell's solution, diluted one half with water, was used to touch the bleeding surfaces. The pedicle was tied with the shoemaker's stitch as recommended by Dr. Marcy. A glass drainage tube was left in the wound, and on the day following the operation one half ounce of black fluid was washed out of the pelvic cavity. Stitches were removed on the eleventh day, and on the day when the case was reported the patient was doing well.

Dr. E. W. Cushing read a paper on

THE USE OF IRRIGATION IN GYN, ECOLOGY.

proved the fact that, as a rule, puerperal fever is systematic use of irrigation, but in office practice simply an infection of the genital tract at the hand the surgeon is tempted to neglect it. In office pracof the physician or midwife. Since then the genius tice a good swabbing of the vagina with sublimate of Pasteur and the labors of Lister have made clear solution on cotton may answer the purpose, or one the nature of the infection, and the teachings of Sem- of the springes may be used which irrigate the vagina cellulitis, or that the endometrium has been infected, of water, a solution 1:2000 will be gained.

He inspects such fractures on the fourth day after and that the infection has spread up the tubes and set up a peritonitis. The immediate cause of such inflammation is an infection with living bacteria or germs; the more or less favorable nature of the soil into which they fall determining whether the symptoms will be slight, with moderate fever and local hardness, or a violent explosion of peritonitis or septicæmia resulting in death.

In some cases collections of bacteria may lie dormant for long periods in the tubes or in circumscribed abscesses, ready to start into activity when released. Self-infection from such sources explains many mysterious cases of puerperal fever and cellulitis. It should be remembered that the vagina is a ventable hot-bed for the development of bacteria, and that an old gleet in the husband may have set up a mild gonorrheea in the wife, so that gonococci or other germs abound, ready to be carried into the uterus on a sound, or to infect any wound which a surgeon may

The writer expressed the opinion that endometritis, erosion, ectropion, etc., may be due to bacterial irritation.

In view of the fact that these septic processes cannot be controlled by treatment after they have been thoroughly inaugurated, it is the duty of the physiciar, first, to prevent such troubles by killing off the bacteria in the vagina and uterns; and second. to avoid operations or harsh manipulations when he has reason to believe that the tubes contain pus.

For the first purpose there is nothing so sure, speedy and convenient as bichloride of mercury. In hospitals it ought to be a part of every vaginal examination or operation to douche the vagina well with 1:1000 or 1:2000 sublimate solution, and to carry some of an even stronger solution or strong carbolic acid into the uterus on a probe. When the cavity of the wound is to be invaded by operation it should be thoroughly washed out with a disinfecting solution. In cystitis, after operation, a sublimate solution of 1:5000 should be run through the bladder, washing it out thoroughly and repeatedly, and be followed by an iodoform emulsion.

Before, during and after all operations upon the cervix, and between packings of the vagina for hæmorrhage, the vagina should be irrigated. For long operations, or where much raw surface is exposed, the solution should be 1:5000 and should be hot. In In 1845 Semmelweiss propounded the theory and hospitals it is comparatively easy to introduce the melweiss have been generally accepted. Now it is without spilling the fluid externally. A sublimate proposed to broaden the application of this principle solution in water does not keep well, and must be of infection and to show that pelvic inflammations of prepared every day. The object of the French Surgical Congress is to practioners of France and foreign countries. All Committee of Arrangements. - Dr. Charles Gilman qualified men become members of the Congress on duly entering their names and on payment of the Amendment to By-Laws.—Create a new Section, subscription of 20 francs. Members of the Congress who desire to make a communication to the meeting Fitts, H. B., P. A. Surgeon, ordered to the receiving ship are requested to communicate their intention to the "Vermont." are requested to communicate their intention to the Secretary-General three months before the opening of the Congress. A summary of the conclusions of their paper must also be forwarded. All communications should be addressed to Dr. S. Pozzi, Secretaire-Général, Congrés de Chirurgie Française, 10 Place Vendome, Paris.

BIRTH AND DEATH-RATE IN ENGLAND AND WALES. —The report of the Registrar General for 1885, just issued, shows that the births of the year were 32.5 to the 1,000 persons living; the lowest number recorded since 1848. With the exception of an insignificant rise in 1884, the rate has fallen continuously year by year since 1876. The male births were 455,809, the female 438,461. It is satisfactory to learn that the long-continued fall in the marriage rate has led, for 1885 at least, to no increase in the number of illegitimate births. On the contrary, the decline under this latter heading has beaten the record in the most encouraging way. The deaths of the year lag behind the births in a way that precludes all anxiety for the immediate future of the race. They were in proportion of 19.0 to the 1,000—with one solitary exception, the lowest yet recorded. Among the deaths were 63 of reputed centenarians, 19 of whom were males and 44 females. The death-rate in the urban population was 20.0 per 1,000, and the lowest on if he thinks the officer is not recovering quickly enough, or his record, while that of the rural population was 17.5, a slight increase.

DR. R. E. CARRINGTON, one of the most promising physicians on the junior staff of Guy's Hospital, has just died of pleuro-pneumonia, after a two days' illness.

A Loyal Dentist.—A dentist in a small provincial town in England, will celebrate Her Majesty's Jubilee by extracting teeth and supplying false ones free of charge on the morning of the celebration.

SURGICAL LABORATORIES.—The surgeons of the London Hospitals have signed a memorial asking the Royal College of Surgeons of England to build a suitable laboratory for the study of morbid anatomy, including histology, experimental pathology, including bacteriology, and of experimental operative surgery. They say that in view of the power and wealth of the college any Fellow or Member who is competent to earry out scientific investigations should be able to do so without inconvenience or expense.

OFFICIAL LIST OF CHANGES IN THE STATIONS AND DUTIES OF OFFICERS SERVING IN THE MEDICAL DEPARTMENT, U. S. ARMY, FROM MARCH 26, 1887, TO

Capt. Harry O. Perley, Asst. Surgeon, ordered for temporary duty at Ft. Maginnis, M. T. S. O. 23, Dept. Dak., March 18, 1887.

Tracy, E. C., Asst. Surgeon, detached from the "Vermont" and ordered to the "Atlanta."

Heffinger, A. C., P. A. Surgeon, detached from the "Atlanta" and ordered on special duty in connection with construction of hospital at Widows Island, Me.

OFFICIAL LIST OF CHANGES OF STATIONS AND DUTIES OF MEDICAL OFFICERS OF THE U.S. MARINE HOS-PITAL SERVICE FOR THE WEEK ENDED APRIL 2, 1887.

Urquhart, F. M., P. A. Surgeon, to assume charge of Cape Charles Quarantine. March 29, 1887.

Norman, Seaton, Asst. Surgeon, to report for duty at Cape Charles Quarantine. April 2, 1887.

NOTES AND QUERIES.

ARMY SURGEONS ON SICK LEAVE.

Dear Sir:-Referring to "Inquirer's" question in THE JOURNAL of March 19, it would seem that he has found a prototype of the famous "Pooh Bah," in a physician who is:— 1st, an Assistant Surgeon U. S. Army; 2d, a local practitioner of medicine; 3d, a holder of a State appointment; 4th, a proprietor of a drug store, as the inquirer states, "all at the same

Now, it would seem that a solution is very easy. If an Assistant Surgeon is on sick leave, undoubtedly his only official duty is to get well; and presumably the Medical Department of the Army is the judge of this matter, though undoubtedly "Inquirer" might take the Surgeon-General into his confidence recovery is hampered by the duties of offices 2, 3, and 4. is not attending to his duty under the second heading, it might be inferred he would have no patients, ergo, nothing to practice on. If he is not fulfilling the requisites of the third office, presumably the State Governor or legislature is open to complaint. And, fourthly, if the drug store is a poor one, it will be a victim to inanition. So, therefore, it seems that the question answers itself, and an Assistant Surgeon U.S.A. can do all of these things.

By section 94, Rev. Reg. U. S. A., 1881, "Whenever an officer has been absent on account of sickness for one year, he may be examined by a Medical Board, and the case specially reported to the President." As the retired list is limited to 400, he may have to wait an opportunity therefor.

Section 106 of the Regulations states: "Retired officers may engage in private business or hold civil offices not contrary Very respectfully, S. T. Armstrong.

Memphis, Tenn., March 22, 1887.

PRIVATE REGISTRATION AT THE CONGRESS.

Dear Sir:—In view of the large number of gentlemen who will undoubtedly attend the International Congress, and who will hope and expect to meet old friends, classmates, etc., would it not be possible for the Committee of Arrangements to request each State Secretary to provide and forward a large registerplainly printed on the cover the name of the State-that every attendant might register his name, residence and stopping place. To the large majority it will be a pleasure trip; they will rely on published transactions for the work of the Congress. The finding of friends is to many one of the chief pleasures; yet we cannot hope to "meet by chance" all those we want to see most. A line of registers, for separate, States will in many ways facilitate the work, and accommodate individuals immensely. If it is thought advisable I will submit my plan in detail to the HIPPOLAPIUS.

Terre Haute, Ind., March 20, 1887.

CORRIGENDA.

CONTRIBUTION TO THE THERAPEUTICS OF WATER, AND THE PHYSIOLOGICAL ACTION OF HEAT AND COLD.

Read before the Chicago Pathological Society, January 11, 1887

BY G. FRANK LYDSTON, M.D.,

LECTURER ON GENITO-URINARY AND VENEREAL DISEASES IN THE CHI-CAGO COLLEGE OF PHYSICIANS AND SURGRONS, SURGEON TO THE WEST SIDE DISPENSARY.

occupied in bacteriological investigations of a more or less practical nature, it is perhaps too much for Floyer, stimulated by his observations upon the popone to expect a subject as old and apparently well- ular application of certain mineral springs in his worn as that selected for discussion in the present vicinity, wrote his noted work, "The History of Cold paper, to attract much attention, or excite a great Bathing, both Ancient and Modern." Following him, deal of interest. I am convinced, however, that Hahn, of Silesia (1738), and the renowned Currie there are those present who, if they so choose, can (1797), wrote treatises upon the subject. In 1804 express views upon the action of heat and cold, and no less a man than Prof. Oertel, of Ansbach, became upon hydrotherapy in general, which will be both a convert to the teachings of Hahn. It was not interesting and profitable. A desire to hear such until 1829 that any attempt was made to construct a expressions of opinion upon a subject in which I am distinct system. In that year, however, Vincenz greatly interested, rather than the hope of adding Priessnitz, who was an untutored farmer of Grafengreatly to our general fund of information, must be berg, Austria, formulated a system of hydrotherapy my apology for presenting this paper.

little understood by the mass of the profession. The wrote a line upon the subject. application of water as a panacea for all our ills, and Faculty.

It would be impossible for me to discuss in detail so comprehensive a subject as the therapeutic action of water within the limits of this paper, and it will be impracticable to avoid touching upon points which

are already more or less familiar.

The therapeutic use of water is of quite ancient origin, and inasmuch as primitive man must necessarily have familiarized himself with the properties of the more common substances with which he was surrounded, it would be strange indeed if he had not discovered the value of water in disease at a very early period. Admitting that he did appreciate its In view of the fact that modern medicine is chiefly value, it is certainly remarkable that nothing was written upon the subject until 1702, when Sir John which, however glaring its faults from a scientific The usefulness of water in its various forms in the standpoint, was marvellously clear and accurate in prevention and treatment of disease is very great, its details. It was not long after the promulgation and its applications to pathological conditions are so of the views of Priessnitz before hydrotherapy, as manifold, that there are few subjects of a therapeuti- an exclusive system of therapeutics, became very cal character so worthy of the attention of the phy-popular, and "water-cures" and bathing establishsician. Simple as the subject may at first appear, ments sprang up rapidly in Germany, England, France the important part which water may be made to and America. This was due to the ardent disciples play in the management of various diseases is but of Priessnitz, and not to him, as he himself never

The comparatively recent date of our recorded the extravagant claims of the system of exclusivism knowledge of the uses of water is especially surprisknown as "hydrotherapy," are of course fallacious, ing when we note the sagacity of the lower animals. and are so often obscured by absurdities and dog- M. Delaunay, in a recent memoir to the Biographical matic sophistry, that we are naturally inclined to Society of London, has dwelt at some length upon condemn its claims to efficiency in toto. Strange as the therapeutic intelligence of animals, and makes it may seem, the first shaft of ridicule aimed at this special mention of their knowledge of cold water system of exclusivism was hurled, not by a medical dressings for wounds, and of cold baths in fever. man, but by that "prince of satirists," René Le Sage. When a dog is suffering with a fever, he will not only Nearly two centuries ago, this author immortalized drink large quantities of water, but will often plunge the hot-water craze in his "Dr. Sangrado." Tradi into a running stream and remain submerged for a tion tells us that this was not an aimless thrust, for considerable time. Wounded cats, dogs and horses the object assailed was no less a personage than the have been known to remain in a pool or stream of lean and lank Dr. Hecquet, Dean of the Parisian water until their hurts were healed. Graves selected as his epitaph "I fed fevers;" Currie should have

starved and purged into untimely graves.

results, it is difficult to differentiate them. In a general way it may be said that there is no difference between the effects of a local hot bath, and those of a hot poultice, so that in speaking of the action of moist heat in any form, we must relegate the matter to the domain of hydrotherapy, although it is hardly fairer than to classify the action of a hot brick or a hot water bottle under the same head.

In discussing the therapeutic uses of any remedy, it is customary to consider its various local and gen eral effects in health and disease, and to attempt the grounds. This plan may be most fittingly applied to planations usually given of the action of hot and guishing characteristics independent of their aggre-cold water when applied to the animal tissues, are gation into formed elements of tissue. Their higher based entirely upon practical observations and theoretical reasoning upon those resultant phenomena involving vascular changes, and the hypothetical tissue changes which are brought about by nervous ininclined to attempt the explanation of many physiomany remedies, by the nervous influences, sympathetic or spinal, involved in the various phenomena, by these nervous influences. Inasmuch as these; changes are all that can be determined by actual observation, it remains to be considered whether theoretical and analogical reasoning will enable us to determine upon the ultimate physiological basis of such phenomena. Now, if we analyze these phenomena, and the tissues involved in their production, we will find something behind all, the reaction of which will explain the various changes most satisfactorily. I refer to the protoplasm or basic substance of the tissues.

The rôle of protoplasm as an entity, independent of vascular and nervous influences appears to me to be a most important one, and too little thought of in

selected one reading, "I cooled tevers." A judicious our studies of nutrition, and the action of remedies. avoid time of drugging, and a combination of cooling. We are taught that protoplasm, even before it has and feeding, saves fever patients to day who less than been differentiated sufficiently to arrive at the dignity a century ago would have been bled, blanketed, of a cell, has properties and functions which are but the prototypes of those possessed by the animal body It is impossible to present, even in a general way, as a whole. It is contractile, irritable, and automatic; the therapeutical action of water, without dwelling receptive, assimilative, metabolic, secretory, respiraupon the influence of heat and cold upon the animal tory, reproductive, and excretory. Such are the tissues. This is especially true of its external uses, properties of the amceba, which is but formless proin which its action mainly depends, not upon its own toplasm; and of how much greater importance these physical properties, but upon the temperature at functions become when, through differentiation, the which it is applied. It is obviously illogical to arprotoplasm is exalted to the dignity of a cell, is illusrange the phenomena resulting from the use of the trated by the experiments of Cohnheim and Waller, hot bath and the spinal ice-bag under the common who, in 1867, so clearly demonstrated the properties head of "hydrotherapy," but it would be impracting the leucocyte. If, then, we consider the matter, cable to separate the effects of a mere variation in we may conclude: 1, that every living tissue has temperature from those of the bath per se. In a less certain vital properties by virtue of its component degree this statement will also apply to the ingestion cells; 2, that the cells of a tissue or organ have cerof hot water, it being difficult to say what proportion tain special properties and functions, few in number, of the benefit thereby derived is due to the water by virtue of their differentiation; 3, that the essential per se, and how much to the heat. The heat im- or main vital properties of the cells are not due to parted to the viscera, and the increased amount of their differentiation, but are possessed by them simply fluid in the gastro-intestinal tract, and in the blood by virtue of the protoplasm of which they are comafter its absorption, being alike powerful therapeutic posed. Bichat conveys a somewhat similar idea, although not so literally expressed, when he speaks of "the vital properties of tissues."

In attempting the explanation of the physiological action of heat and cold, we will consider, not the tissues as a whole, but the protoplasm or basic substance as an entity; and as a warrant for this, the following proposition may be advanced, viz.: Tissues are endowed with certain properties which we term vital, because the cells composing them have vital properties, and these cells are possessed of vital properties, because the material of which they are composed has explanation of its action upon purely physiological vital properties and functions independent of those qualities acquired through its differentiation into cells, the remedy at present under consideration. The ex- just as the latter have certain properties and distinfunctional evolution, of course, depends upon their aggregation and organization into tissues and organs, but apart from this, their elementary properties prevail. It is upon modifications or perversions of the fluences, vaso motor or inhibitory. Indeed, we are vital properties of tissue (i. e., its protoplasm), that pathological phenomena depend, and the science of logical and pathological processes, and the action of therapeutics depends upon the correction of such perversions, by the action of remedies.

There is a class of diseases which, in the absence or by the vascular and gross tissue changes produced of perceptible change in the tissues, macroscopical or microscopical, we have been compelled to term "functional" in lieu of a better name. The number of these diseases has steadily grown smaller, pari passu with the discoveries of chemistry and microscopy; but there are still remaining ailments which medicine confesses itself unable to account for, although loth to accept them as "functional." May not the morbid condition in many such cases consist of a perversion of the life properties and functions of the protoplasm of the affected part, too obscure to be demonstrated by any known method of research, and involving certain occult derangements of

¹ Text-book of Physiology. By Michael Foster.

tissue metabolism? The development of medical our centre, which presides over the nerve and is seience in this direction will probably be through a responsible for its special functions. How many more perfect knowledge of physiological chemis- and what vascular effects may result from simple try. Judging from the results of the experiments protoplasmic changes in the venous and arterial of Gautier and Selmi, we are already beginning to walls, would be difficult to demonstrate or even get glimpses of light. Certain it is that the discov- conjecture, but that definite effects do result from ery of promaines and leucomaines is destined to be such changes is quite probable. Could they be disof great pathological as well as physiological im-covered, we would undoubtedly be greatly enlightportance.

forcibly present the importance of protoplasm as an activity are the basis of many pathological conditions, entity in biology, may be mentioned Huxley and and especially those of an inflammatory character, Martin,2 and Clevenger.3 These eminent authorities, and as a corollary we may accept the theory that a in describing the life history and properties of the stimulation on the one hand, or a depression on the amceba, have practically presented the independent other, of bioplasmic activity, will explain the effects vital properties of protoplasm, as the basis of all the of the application of heat and cold under certain phenomena of organic life, and in a most striking conditions of disease.7 manner. Based upon deductions from the writings of these authors alone, we might venture to advance tion regarding a therapeutical problem, to attempt the following as an excellent proposition, and one the reconciliation of conflicting elements in the form which is apt to prove serviceable in the study of all of apparently contradictory facts. This is especially physiological and pathological processes, viz.: As necessary in the present instance, inasmuch as the are the properties of its protoplasm, so are the prop-profession generally accept the view that there is no erties of the cell, and the latter are always subservi- essential difference in the action of heat and cold in ent to the former. A cell without protoplasm is inflammation. From a clinical standpoint, this apimpossible, but the protoplasm, unorganized, has pears to be true in acute sthenic inflammations, but still its distinctive properties and functions, albeit that the beneficial effects are produced in the same they may be intensified by differentiation.

convinced of the independent importance of protoplasm in the phenomena of life, for some of our most. The surgeon who believes implicitly in the theory of noted biologists dispute the dictum of the great the similar action of heat and cold, would be apt to master, Virchow, in his doctrine of "omnis cellula e find himself in trouble if he applied his theory indiscellula." Heitzmann, and following him, Stricker, criminately. Surely, the same line of treatment claim that the tissues are built up of small masses of would not be equally beneficial in a robust patient a homogeneous undifferentiated basement substance with a traumatic arthritis, and a broken-down hospi-(protoplasm, "bioplasm" or "bioplasson") bound tal patient with phlegmonous erysipelas. together by a delicate reticulum of fibrillary structure. Elsberg, in his studies of hyaline cartilage, synovitis upon the same principle as an acute joint demonstrates the importance of the same substance. There are, then, many excellent authorities for the the subject, the narrower the range of the indifferent position assumed in the present paper, although I am last mentioned as to the unimportance or non-existence of the cell in organized tissues.

To apply the theory advanced to the explanation of the action of heat and cold, or of any other agent capable of making a definite impression upon living tissue, we may accept the proposition that the changes which are induced by such agents are but a manifestation of the aggregate activity of the various cells involved, they being the primal factors in the various physiological or pathological phenomena. In this, they act simply as differentiated protoplasm. The nervous currents may be said to be merely special manifestations of protoplasmic activity, resulting in an alteration of the molecular arrangement of the cells and fibres constituting the nervous cord, and of the special collection of cells termed a nerv-

ened upon the phenomena of inflammation. It may Among the modern writers who appreciate and be assumed, then, that perturbations of bioplasmic

It is always essential in assuming a definite posiway, is negatived by the difference in their action We are not lacking in other authorities who are upon healthy tissues, when applied at a temperature short of that required to completely destroy vitality.

Again, it would hardly be proper to treat a chronic inflammation. In fact, the more carefully we study application of heat or cold becomes. Life, as denot prepared to accept the views of the biologists fined by De Blainville, "is a double internal movement of composition and decoraposition; at the same time general and continuous." One of the principal elements of life, therefore, is tissue metabolism. Heat favors chemical changes in Nature's laboratory, as well as in that of the chemist, and it consequently favors physio chemical as well as inorganic chemical processes, and interchange of ele-

⁷As an illustration of the powerful influence which changes of temperature exert upon living protoplasm, I would direct attention to the phenomena attendant upon the incubation of the chick. The protoplasm of the egg contains the inherent energy, or potential vitality, necessary to develop a chick, but it requires the influence of steady and continuous heat to develop the dynamic vitality requisite for the formation of a living animal. This illustration is in itself sufficient evidence of the important influence of warmth over physio-chemical and strictly physiological changes. The disastrous effect of chilling is obvious, and even the instinct of the mother fowl teaches her how long she may safely absent herself from the next. It is well known that the conditions under which the human ownin develops are essentially the same as in the incubation of the chick. As an apt illustration of the disastrous effects of cold upon the vitality of cells, the effects of cold water upon living spermatozoa may be cited. atozoa may be cited.

atozoa may be cited.

There is a strong analogy between the process of repair in wounds and inflammations, and the development of the oxim, and the moderate and continuous application of heat favors this process. In preparing a protection for the child, Nature has surrounded it during intra-uterine life

by a warm, fluid environment.

mentary molecules. If, as has been claimed, in-benefited by either hot or cold applications, if proptlammation depends primarily upon retarded tissue erly used. metabolism, it is quite easy to understand how moist heat will act beneficially, from a purely chemical a rule, it should not be continued after the violence standpoint. This fact would also explain the ap- of the inflammatory process has sensibly abated. parent paradox of an acute inflammation being benefited either by cold or heat, the former affecting productive of better results than cold, and they rarely, chiefly the attendant vascular phenomena and hyper- if ever, are productive of injury. nutrition, while the latter, aside from its merely emollient effect, tends to remove the original cause. should be kept as equable as possible, for nothing is The balance of benefit, even in acute inflammations, so injurious as alternations of heat and cold in acute is in favor of moist heat. The prolonged application inflammation. of cold is apt to prove injurious, and to induce pus formation by depressing the vitality of the exuded heat is the most efficient agent, by virtue of its stimcells. The prolonged application of heat is rarely ulating properties. By alternating with cold, this productive of injury, and if pus forms it is in spite stimulating effect upon the absorbents and the walls of, and *not* because of it.

With reference to retarded metabolism giving rise to hypernutrition, the latter appears to be the result of a vicarious strain upon the tissues surrounding the original focus of irritation, and is itself followed, las, gangrene, phagedæna, etc., heat is a most valuafter a time, by retarded chemical change, hence the lable agent. As a matter of personal experience, I inadvisability of prolonging cold applications. It is can certify to the great benefit to be derived from as a result of these changes and of the pressure of hot applications in phlegmonous erysipelas. The inflammatory exudate that necrosis of various tissues improvement in the results obtained by hot applicaoccurs in certain inflammations.

CLOSURE OF THE JAWS AND ITS TREATMENT.

Read before the College of Physicians of Philadelphia, February 2, 1887.

BY J. EWING MEARS, M.D.,

PROFESSOR OF ANATOMY AND CLINICAL SURGERY, PENNSYLVANIA COLLEGE OF DENTAL SURGERY, SURGEON TO ST. MARY'S HOSPITAL.

At the meeting of the American Surgical Association, June 1, 1883, I read a paper on "Closure of the Jaws and its Treatment." In this paper, which was published in the first volume of the Transactions of the Association, I described the two forms of carrying out the necessary manipulations within the permanent occlusion of the jaws—one due to the formation of osseous or cicatricial bands between the alveolar processes, and the other dependent upon ankylosis of the temporo-maxillary articulation, either fibrous or osseous in character. I gave also a resume of the methods of operation which had been suggested and practised for the relief of these is made in front of the contraction. Its inapplicaconditions, reported the almost universal failures of bility when both sides are affected, and the deformity these methods in obtaining successful results, as gathered from the reports of cases, and stated the objections to their employment. That a better ing the formation of a false joint by simple division understanding may be had of the subject, I give, at of the bone—the tendency to reunion being much this time, this résumé.

A résumé of the methods of operation which have closure of the jaws shows that they have been as follows:

- 1. Division of the cicatricial tissues. Section of the masseter and temporal muscles, as originally suggested by Carnochan, when division of the cicatricial bands is insufficient.
- 2. Excision, more or less complete, of the cicatricial bands or osseous formations, and the subsequent employment in case of the former, for a long period of time, of wedges and levers to maintain the separation of the jaws. tion of skin, as practised by Jaesche.
- brane at the base of the alveolus.
- behind the point of contraction.
- incision.

In closure due to ankylosis of the temporomaxillary articulation, the methods practised are:

- 1. Formation of a false joint by exsection of the jaw, by external incision (Carnochan's suggestion), or the division of the ramus from within the mouth, either by saw, forceps, or chisel.
- 2. Exsection of the condyle with a portion of the neck, the incision being external, as practised by Professor S. D. Gross.

The objections stated were as follows:

- 1. To incision and excision. The reformation of the cicatrix and the great pain to which the patient is subjected in the use of wedges, levers, and screws —the difficulties of securing flaps of mucous membrane and skin from adjacent parts and their successful transplantation. The almost universal failures.
- 2. Division of the Cicatricial Bands and Use of Shields. The pain and inconvenience experienced by the patient in the use of the shields, and difficulty of obtaining the full cooperation of the patient in
- Section of the Ramus behind the Contraction— Dieffenbach's Method. The difficulty of obtaining a permanent false joint after simple section of the bone.
- 4. Esmarch's Method. The loss of one-half of the jaw for the purposes of mastication, where excision which results.
- 5. Rizzoli's Method. The difficulty in accomplishgreater than when a segment is removed.

Having given this résumé of the different methods been suggested for the relief and cure of permanent of operation and the objections which I believed to exist against the accomplishment of entirely successful results by their employment, I described a method which I had practised in a case of jaw closure due to the formation of osseous and cicatricial bands, involving the left side, the result of a gunshot wound. The injury was received when the patient was 2 years of age, and the operation for her relief was performed on January 26, 1883, eighteen years later. The plan of operation practised, and which differed from those which had been employed, consisted in Transplantation of the exposure of the temporo-maxillary articulation mucous membrane to cover the surface of the by an incision along and below the zygomatic arch. wound, as suggested by Dieffenbach, or transplanta- the excision of nearly the entire ramus of the jaw with the coronoide and condyloid processes, section 3. Division of the cicatricial tissues, and the adap- of the masseter, temporal, and external pterygoid tation of metal shields, not only to prevent recontract muscles. The osseous plate which had formed betion, but to re-establish the sulcus of mucous mem- tween the alveolar processes on the palatal surface was sawn through, the saw having been introduced 4. Dieffenbach's method of simple division of the between the teeth to accomplish this purpose. The ramus of the jaw-and the formation of a false joint jaws were now separated to the extent of an inch. The subsequent treatment consisted in the daily use, 5. Esmarch's suggestion that the joint be formed for a period of four weeks, of my mouth-gag, during in front of the contraction, and that a segment of the formation of the artificial articulation, with the bone be removed for this purpose—by external result of securing a separation of one and a quarter inches. About the middle of January, 1887, four 6. The formation of a false joint in front of the years after the operation, the patient called upon me. contraction by simple division of the bone, made by and I found the separation of the jaws to be over forceps applied within the mouth-Rizzoli's method. one and a quarter inches, and the movements in everv respect normal. The patient is unable to recognize any difference, in motion or in sensation, between the natural joint on the right side and that formed upon the left.

Since the time of this operation I have had six cases of jaw-closure, in four of which I have operated by methods somewhat different from that above described. Of the six cases five were due to bony ankylosis occurring in the temporo-maxillary joint.

tirely obliterated by the formation of masses of dense method of slow division by ligature as possessing adand permitted the separation of the lips only. This employed. condition followed an attack of noma, in which the entirely destroyed by the inflammatory action, the the jaws are firmly locked by broad bands it may be tongue and lower jaw on the right side being liken necessary to pass the ligature from behind, introduction in the latter. In the report of border of the cicatricial band, and carrying it forstated that I had not divided the cicatricial band the needle, it may be carried along the inner surface be made of these bands. In this case, however, the in certain cases to divide the bands in portions cicatricial bands were so extensive, reaching from rather than en masse. Care should always be taken the ramus of the jaw to the angle of the mouth, and to avoid implication of the duct of Steno. were so unyielding that it became necessary to spaces free. Reformation of the tissues followed, velopment. and, with their recurrence, closure, not, however, to the full extent.

failures which accompanied the methods employed, scarlet fever. Closure of the jaws had existed for induced me to make an effort to effect division of four years. In this case one and a half inches separathe dense tissue by means of a ligature, believing tion was permanently secured. that reunion could thus be partially, if not completely, prevented. In this expectation I was not altogether in my first case, by effecting excision of the upper

disappointed.

Having armed a strong-handled needle with double-loid processes through the mouth, avoiding in this twisted carbolized silk ligature, I passed it from the way an external cicatrix. angle of the mouth backward between the integument and the outer surface of the cicatricial mass, sharp-pointed bistoury is introduced beneath the and caused the point to immerge just behind the masseter muscle on a level with the last molar tooth last molar tooth of the lower jaw. In this manner of the lower jaw. Into the wound thus made the I surrounded the cicatricial tissue with the ligature, blade of an Adams' saw is passed, and the ramus which was tied loosely and moved each day for a sawn through. The periosteum, with the overlying week, so as to establish a canal which would not masseter muscle, is raised by the periosteal elevator. readily close. At the expiration of a week I tight- and the wound thus enlarged. MEDICAL PROGRESS.

Fifteen years ago there was introduced from Brazil a Hospital.—Lancet, March 12, 1887. remedy which was claimed to be a specific for cancer. Since then, as before, other remedies have been similarly vaunted, and none have stood the test of Carbolized Spray.—Gilles of La Tourette, of experience. The remedy in question was condur. Paris, presents in detail three cases of stubborn ango bark, of which a trial was made at the Middle ulcers of the leg in inmates of the Insirmeric des In-

that he doubts whether its qualities as a stomachic The suture should now be introduced. The first are better than those of other drugs of that class, point corresponding to the point at which they a tumor) that the best effects were noticed. In 105 This may seem to be a difficult stitch, but charged in improved health, remained much longer which, subsequently dying, presented only cicatricial When the sutures are placed and before they are structure, with no trace of malignant disease. Obtightened, the sphincter ani should be thoroughly viously, before we can accept such cases as examples stretched. This, to a certain extent, relieves the of the cure of cancer we must be certain that the tension on the sutures, and at least adds largely to original diagnosis was correct, and the same skepthe comfort of the patient by preventing straining at ticism may be allowed respecting the whole series of Another thorough cleansing of the parts cases. For cancer of the stomach may not only be should be done, and the sutures should be tightened latent, but may be simulated by non malignant ulcerfrom below upward. The urine is not drawn unless ation, as every physician knows. Dr. Riess fairly the patient is unable to pass it. The parts are washed discusses this point, being quite alive to the objection. He claims, at least, that condurango has some local effect upon a diseased stomach, and considers that in all suspected cases it should be prescribed. It need hardly be pointed out that a local action as here claimed is a very different thing from a specific action in cancer generally, which was sufficiently CONDURANGO IN CANCER OF THE STOMACH,— disproved by the observations at the Middlesex

THE CURE OF LARGE ULCERS OF THE LEG BY THE

curables connected with the service of Charcot. The any conjunctival or other irritation set up by its use, general condition of the patients was of the worst and I have found one grain to the ounce a sufficiently description. The first was an extremely debilitated strong solution for my purposes. and emaciated subject of asthma conjoined with chronic bronchitis, 60 years old, presenting an enor- mydriatic power, scopoline is able to effect some mous ulcer covering the whole right leg, from the control upon the vascular supply of the eye; the malleoli to within an inch of the tuberosity of the drug may be, indeed, the physiological antithesis of tibia. The carbone spray for an hour and a half eserine; at present, I am engaged upon an inquiry morning and evening, with intermediate dressing with with Dr. P. S. Abraham, into the physiology and borated vascline, caused a complete cure in less than chemistry of the drug, and we hope before long to a month. The second was an ulcer, eighteen centimeters high, covering the lower half of the leg in a 8, 1887. patient 82 years of age, feeble and senile, and the subject of chronic bronchitis. Carbolized spray for two hours twice a day with borated vaseline dressing in the intervals, secured a complete cure in about six weeks. The third case occurred in a syphilitic subject, with mitral insufficiency, tertiary syphilis and chronic bronchitis, aged 59, with a vast ulcer, twenty-two centimeters long, enveloping the whole leg. Carbolic spray applied during the next six months had brought the ulcer down to about the size of a six sous piece when the patient died by his own hand. As the result of his observations, the author concludes: a. The method of carbolic spray repeated daily for an hour and a half, morning and evening, beter than any other method leads to a rapid cure of large varicose ulcers. b. In the early part of the treatment, the pains seated in the ulcer disappear. In the three cases observed, no erythema ever appeared at the margin of the wound, nor did the patient ever void the black urine indicating carbolic poisoning. c. A state of debility or senility of the patient does not in any way contra-indicate the employment of the method, which, on the conseems formally indicated in this particular case. d. The solutions used are the stronger, as the ulcer is the more atonic; solutions less than I to 50 should be rejected and even the greater strength, $\frac{1}{3}_{0}$, $\frac{1}{20}$, or even $\frac{1}{10}$ could be used. In the interval between the applications of the spray, the dressing of borate of soda and vaseline, 1 to 10 will be found useful.— Revue de Chirurgie, July, 1886.—Annals of Surgery, sen in Munich, has used antifebrin, and reports as March, 1887.

new mydriatic, introduced by Pierd'houy, is, as far sipelas a dose of 8 grains was vomited when given by as my experience of it goes, a useful drug. Since the mouth; when given by injection it was retained. the beginning of the current year 1 have employed. In general the drug was well borne; half the patients it almost continuously amongst my out patients at had profuse perspiration following, and an exanthem the West London hospital, not for the purpose of occurred in one case. Cases of typhoid, treated with testing its qualities as a mydriatic, but as a drug to antifebrin, had an easy course. The influence of supersede atropine in the treatment of keratitis, cor-'the drug was generally manifested two hours after it neal ulcers, and iritis. I have found that in the case had been taken. After a dose of 4 gr. the temperaof troublesome corneal ulcers which had been treated ture sank six times from .1° to 1°, thirteen times respectively with both atropine and eserine without from 1° to 27, fifteen times from 2° to 3°, six times success, rapid improvement followed the installation from 3° to 4, and three times more than 4°. After of scopoline. And especially was this good effect a dose of 8 gr. a depression of temperature of .1° to shown in cases of severe interstitial keratitis, in 1° occurred three times; from 2° to 3° seven times; which attropine had been previously employed, from 3 to 4 twice; from 3 to more than 4 twice. Again, in rheumatic iritis the use of scopoline was tion of the globe. Upon no occasion have I seen Medizinal Zeitung, No. 51, 1886.

I am disposed to believe that, in addition to its publish the results.—British Medical Journal, Jan.

PEROXIDE OF HYDROGEN IN WHOOPING-COUGH.— DR. BENJAMIN WARD RICHARDSON, states that he has treated nine cases of whooping cough with peroxide of hydrogen exclusively, in six males and three females, all children. The solution was given in doses of a fluid-drachm five or six times a day. The remedy in this affection has a decided value. Commencing with it in the acute stages of the disease, and trusting to it alone, he has never seen pertussis cut short so quickly and determinately by any mode of treatment except change of air. He had previously used dilute nitric acid in whooping cough, as advised by the late Dr. Gibb, and with satisfactory The peroxide appears to him to act in a manner very similar, but, he thinks, with more effect. It subdues the spasmodic paroxysm, checks the secretion in the throat, and shortens the period of the malady, lessening, thereby, the dangers of aftereffects. The mode of prescribing it is:

Hydrogen peroxide (10 vols. strength).... 3vj.

To make a solution of three fluid-ounces, of which trary, by the local stimulation, which it determines, let half a fluid-ounce be taken in a wineglassful of water as directed.

When there is a stridulous spasm with the cough he substitutes ozonic ether 3ij for the solution of the peroxide, or adds it to the mixture.—The Asclepiad, No. 13, 1887.

Antifebrin.—Eisenhart, in the clinic of Ziemsfollows: The number of cases observed was 30. The doses given were from 4 to 8 gr., in powder and Scopoline.—Mr. H. Percy Dunn says: This solution, by rectal and anal use. In a case of ery-

In doses of 4 to 8 gr. antifebrin is a very valuable obviously effective in reducing the pain and inject febrifuge, reasonably certain of success.—Deutsche

ment of appetite and consequent gain in strength and weight. This improvement of symptoms is manifested, moreover, so soon, that Bergeon says the patients may be considered convalescent oftentimes in from fifteen to twenty days. Is it strange then that the laity and profession alike are being carried away by enthusiasm'. What other line of treatment is there that will accomplish as much and in so short a time, if at all! Moreover, Bergeon, Cornil and others cite cases in which all symptoms of disease have disappeared and only signs remain indicative of once active, but now quiescent pulmonic lesions. Fursigned. When neither is accessible, remittances may be made at the risk thermore, M. Chantemesse has reported this treatment as strikingly efficient in allaying paroxysms of asthma. It is said to mitigate the severity of whooping cough, as well as to abbreviate the duration of the disease. Chronic bronchitis is also favorably influenced; while septiciemia and other blood diseases dependent upon the presence of germs, are likewise amenable to this method of therapeutics. Enemata If experience justifies the claims of M. Bergeon of carbonic acid gas charged with hydrogen sulphide for his method of dealing with this deadly foe to are said to be tolerated without ill effects to the pa-

by advertising charlatans dangerous. This view of the case also should be set before the press of the country lest enthusiastic, unscientific and exaggerated reports of the success of the method arouse hopes never to be realized, if indeed nothing more serious should result. It is too soon for this treatment to be characterized as a cure for consumption, as it is being heralded by the quacks and the press. It must first be tested critically and established upon a scientific basis. To this end M. Cornil has instituted a series of careful experiments upon tubercularized animals, to ascertain if this treatment possesses microbicidal virtues. or whether its effects are due solely to the power of disinfecting the products of suppuration within the lungs. The profession awaits with interest the results of these experiments. It is to be hoped that Bergeon's method may not share the fate of so many other vaunted weapons against this dire disease. Meanwhile a word of caution to the wise is sufficient.

The author draws the distinction between fat and lean diabetics, and gives as important rational signs of diabetes, polyphagia, polydipsia, and polyuria. Isolated polyuria (diabetes insipidus) is not rare in women.

Esbach has made persevering researches on the chemistry of glucose, and recognizes only two certain means of discovering its presence in the urine: Fehling's liquid and the polarimeter. The measure of the density is not always significative; however, it is rare that beyond 1030 there is not glucose. As to treatment, he recommends diabetics to drink largely according to their thirst, in order to diminish glycæmia as much as possible, water being the accelerator of all the secretions, of all the nutritive processes—the medicament par excellence. The treatment by drugs, he says, is almost nil. With the exception of the alkalies the general treatment is founded almost exclusively on alimentary hygiene. Two methods are vaunted as being capable of combating the glycosuria: The first is by the complete suppression of all farinaceous and saccharine substances until the entire disappearance of glucose in the urine takes place, the Dr. Esbach, Chef of the Laboratory of Clinical exclusive use of gluten bread being at the same time Medicine at the Necker Hospital, has lately written prescribed. After six months' absence of the glycoformed into force and heat, pass through it without urine. This method is specially applicable to old and being utilized and are eliminated by the urine in the confirmed diabetics. In his menu, the author allows form of sugar. The author reserves the name of his diabetics the use of coffee without sugar, or it glycosuria (symptomatic diabetes) for cases in which may be sweetened with glycerine, without, however, the diabetes has not a special existence. The mind should be kept perfectly quiet, and the patient should avoid honorary one, but he who accepts it should feel it a politics and the reading of medical works.

THE DUTIES OF SECRETARIES OF SECTIONS.

In view of the approach of the annual meeting of the American Medical Association, we would again call attention to some defects in the practical working of the Sections of the Association, and chiefly to the fact that the discussions on papers are not fully reported. The discussions as sent with papers to this office are usually entirely valueless, and in Secretary to be incorporated in his report. The not a single case for two years have they been at all JOURNAL does not publish separate reports of the full. It is of no interest to a reader to know that Sectional meetings of the Association, and when a certain paper "was discussed by Drs. Brown, they come to this office they are only so much waste Jones, Smith, Johnson and several others." We gain paper. What is wanted of the Secretaries of Secno valuable information by reading that "Dr. ____ tions is an accurate and full report of the discussions asked a question about the dose of croton oil, and on papers read in the Sections, giving simply the Dr. - answered it." It is of no value to know name of the author and the title of his paper, and that "Dr. — 's paper was ably discussed by several the date on which a paper is read, so that it may be gentlemen." We must presuppose that all papers published in its proper order. Abstracts of papers read before the Association are discussed by gentle- read in the Sections are of no value whatever, as men when discussed at all, but it is for the readers of the papers are published in full in The Journal. the discussions to say whether the discussions were able or not. Our curiosity is excited by reading in a Secretary's report that "The discussion was closed by Dr. ---," but our stock of information is not papers are published at different times, not in a increased.

the labors of the Secretaries, and have their remarks appear in a much more readable and valuable shape by writing out their remarks, wholly or in part, as far as possible, before going to the meeting of the Association. This can be made more practicable by having the author of a paper indicate to the Sccretary of his Section those who would be likely to take part in the discussion, and have the essential points sent to them before the meeting. It is done may subsequently deprive the members and readers in other scientific bodies. And should any matter of The Journal of much valuable material. come up which has not been embodied in the written discussion, it can be easily added to what has been written. And should no new point come up the dis- - The number of students receiving the degree of cussion is ready to be handed over to the Secretary. Doctor of Medicine at the several recent annual To say the least, those who discuss papers should do Commencement exercises in the regular colleges all that they can to assist the Secretaries in making was, Rush Medical College, 134; College of Physiout a useful report of the Sectional meetings. If a cians and Surgeons, 53; Chicago Medical College, paper is worth discussion it is worth while for those Medical Department of Northwestern University, who discuss it to make a little self-sacrifice in having 44; Woman's Hospital Medical College, 25. Maktheir remarks appear in proper form, and accurately. ing the total 256, representing about 750 matriculants.

The position of Secretary of a Section is a purely duty to do his work properly and carefully. It is regarded as an honor to be elected to such a position, but it should not be regarded as an honor which entails no duty or work on the recipient. No one should accept the position who is unwilling to do the work devolving upon him. It is entirely useless for a Secretary to report in full the business transactions of his Section to the Editor of The Journal. This properly belongs to the business of the Association, and as such should be sent to the Permanent It will be noticed that in The JOURNAL the discussions, such as are sent, are placed immediately after the papers. The reason for this is obvious: the lump, and it would be annoying to have to refer Those who take part in the discussions can lighten back possibly eight or ten numbers to read the discussion on a certain paper. In reporting discussions, and giving names of authors of papers and of those who take part in discussions the Secretaries will prevent much confusion by giving the full, or usually known names, postoffice, and State of each person.

> We know that absolute attention to all details may deprive some of much of the social enjoyment of the meetings, but neglect of these details and duties

column will be found the usual notice for the annual artificial opening. meeting of the Illinois State Medical Society, to be held on the 17th, 18th and 19th of May, in this city. It is very desirable that the profession in every part of the State should be represented in the coming could be seen between the two openings in the meeting. The recent death of Dr. Wm. T. Kirk, of intestine. Atlanta, devolves the duties of President upon the first Vice-President, Dr. Elias Wenger, of Gilman. Members of the Society will meet a cordial reception from the profession in this city.

SOCIETY PROCEEDINGS.

MEDICAL SOCIETY OF THE DISTRICT OF COLUMBIA.

Stated Meeting, February 23, 1887. The President, Jos. Taber Johnson, M.D., IN THE CHAIR.

(Concluded from page 413.)

Dr. J. Ford Thompson gave the history of a case of

LAPAROTOMY FOR INTESTINAL RUPTURE.

Called in June, 1885, by Dr. Henderson, to see A. B., a young man of 18, who was suffering with the Czerney-Lembert method with three layers of symptoms of obstruction of the bowels. He found fine silk sutures. This fistula was about six inches a large, hard tumor in the right iliac region, which above the ileo-cæcal valve. was very tender on pressure.

and copious injections, however, relieved him.

boy whom he found much more ill than at his first visit. There was vomiting, and a tumor in the right means as before failed to give relief.

On May 4, he explored the tumor with a needle second fistula as he had the first. and found pus and faces. It being impossible, owing to other important engagements, to operate that fourth day an enema brought away fæces *per rectum*. day, the next morning (May 5,) he made a long in- On the eighth day, however, fixees appeared at the cision over the tumor and evacuated an immense artificial anus, and they have been discharging from amount of fieces. He seized a fistula in the colon there ever since, although there is an occasional just below the ileo-caecal valve and drew it into the movement from the regular passage. This proves wound. As far as he could see the abdominal cavity that his estimation of the condition of the ileo-cæcal was filled with fieces. The cavity was washed out valve was correct. with hot water, but the fæces seemed still to be escaping into it.

opening about 1.25 inches in diameter. The condition of the tissues around the opening would not permit him to close it in the usual way, so he stitched ence, as one almost always leads to the other. it at each end to the incision, thus making an arti water and fæces.

HILLINOIS STATE MEDICAL SOCIETY.—In another all the faces were being discharged through the

The wound in the parietes closed so rapidly that it had to be occasionally dilated to admit of the exit of the fæces.

The gut, however, did not unite, and the epiron

About two months after this, having slightly enlarged the parietal wound, he carefully applied Gross' enterotome to the epiron. In six days the instrument came away but the fistula still remained patent.

The patient was now in a good state of health, but was very much troubled by the continuous discharge of faces through the artificial anus. In fact, his life was made unbearable, and both he and his parents were very desirous that some curative operation should be done.

Dr. Thompson having fully explained the uncertainties and dangers, as well as the possibilities, of a radical operation, readily obtained consent to the

On December 11, therefore, assisted by Drs. Henderson, G. W. Johnston, Sprigg, Leach and Cutts, he once more opened the cicatrix of the old incision. Having broken down the adhesions of the gut to the parietes he had no difficulty in finding the opening into the intestine. This was of considerable extent, and to his surprise in the "small" intestine, while it had been the "colon" which he had previously stitched to the wall. He, however, pared the ragged edges of the fistula and joined them by

This adhesion, he thought, was the one and from the operation of button-holing the bladder, which caused the strangulation, because it seemed he would think the most proper operation in the pres- that from that part upward the black strangulated ent case would be cutting through into the bladder portion began and extended six inches. The other by the vagina. Dr. Mooney said that the patient portions of the bowel, which were matted together, suffered intensly from cystitis. There would be a were not in that apparently lifeless condition. The greater surface for the absorption of morbid material question came up, whether or not the bowel which if the attempt had been made to stretch the urethra appeared black and lifeless was possessed of sufficiinstead of cutting. He finds that in dealing with ent vitality to warrant its retention in the abdomen. the urethra, even for ordinary trouble, as in irritable It was replaced without performing excision. We urethra, there are not only one, but sometimes three know that in many cases of strangulation the bowel or four fissures made by the dilatation.

operated on, was taking 2½ grains of morphine the band which held a portion of the intestine down, daily to control the severe pains she had. Since the the peritoneum was removed from the portion of the operation she has had one dose of morphine, of 1/4 gut over which it passed. This is an important grain, and no more. The incision has not closed; question in excision of a portion of the stomach or it was only made three days ago. He does not intestine. Whether or not the vitality of the bowel think we necessarily have a vesico-vaginal fistula in suffers to any extent after removal of the perithese cases. Thomas and Emmet say it is very hard toneum, he was not prepared to say, but he would sometimes to keep the opening patent. He ex-judge from observation and reasoning that the limited plained to the patient that she would probably have portion removed from the bowel would not seriously to have another operation performed.

STRANGULATION OF THE BOWEL.

The case was brought to the City Hospital three days since with symptoms of acute intestinal obstruction. He was a delicate looking man, about 34 years of age. He stated that some ten years ago he had dysentery; also again about three years ago, shortly afterwards he had an attack very similar to the one for which he entered the hospital. Three days prior to admittance he was taken very suddenly ill with intense pain in left iliac region, which soon extended over the entire lower portion of the abdomen. It was intermittent in character. His bowels had not moved since the attack, nor had any flatus passed. He had vomited persistently, ejecta being stercoraceous. The least pressure over the abdomen gave intense pain. His condition bordered on collapse. I ordered morphia, stimulants, hot bottles, etc., and concluded to wait for some reaction before operation. The vomiting did not again occur, and reaction was established by the following morning. When Dr. Lutz saw him, his condition appeared so good that we thought it advisable to delay the operation. Dr. Lutz performed laparotomy at 4 P.M. The patient did not rally, and died two hours afterwards. Dr. Lutz will describe the operation.

Dr. Lurz said, the man's history was a peculiar band firmly binding down the gut, beginning in front DR. R. Funkhouser thought one point a very im- and passing over the bowel, downward toward the is returned because the blood supply is extensive DR. MOONEY said that this patient, before she was and the gut soon regains its vitality. In removing interfere with the nutrition, and is not productive of DR. H. C. Dalton gave the history of a case of a sufficient amount of peritonitis to jeopardize the result of the procedure. The fact that the bowel was made impervious by this band had demonstration by the escape of the intestinal contents after the removal of the compressing force. There is no question in his mind that the procedure was justifiable, nor was the diagnosis of intussusception warrantable from the symptoms.

> Dr. I. N. Love thought the developments following the operation fully justified Dr. Lutz in performing it. The important lesion that we learn from this case is that we should direct our attention to the local condition.

GYNÆCOLOGICAL SOCIETY OF BOSTON.

Annual Meeting, January 13, 1887.

THE PRESIDENT, H. O. MARCY, M.D., IN THE CHAIR.

H. J. HARRIMAN, M.D., SECRETARY.

The following were elected

OFFICERS FOR THE ENSUING YEAR.

President, H. M. Field, M.D.

Vice-President, Horace C. White, M.D.

Secretary, H. J. Harriman, M.D.

Treasurer, W. Symington Brown, M.D.

W. Stevens, E. C. Keller.

P. Weeks and H. O. Marcy.

The President Dr. H. O. Marcy, read his Annual Address, entitled "Recent Advances in Abdominal Surgery."

Dr. E. W. Cusming reported a case of

MELANCHOLIA; MASTURBATION; CURED BY REMOVAL OF BOTH OVARIES,

and presented the ovaries. The history of the case was as follows: French Canadian, 33 years old. Since the age of 15 has suffered from dysmenorrhea Since the age of 15 has suncted from a successful and intense pain in both ovaries; has been a con-which might be cared by removar or the ovaries and intense pain in both ovaries; has been a con-which might be cared by removar or the ovaries. That lately lost flesh rapidly, In reply to Dr. Cushing as to whether, in his opinion, and the overlap and and had sunk into a state of profound melancholia there was any hope of curing such cases by moral on account of the belief that she had committed the means. Dr. Bowditch said that there was absolutely unpardonable sin, and was eternally damned. Was no hope from moral means. In reply to Dr. L. F. unable to attend to any occupation, and begged that Warner, he asked if Dr. Bowditch would advise the some operation might be performed in hope of relief, corresponding operation for a similar condition in a She was seen by Dr. H. I. Bowditch and Dr. H. O. man. He said that he had never seen a case in a Marcy, who advised removal of the ovaries. OBSTETRICAL SOCIETY OF PHILADELPHIA.

Stated Meeting, March 3, 1887.

THE PRESIDENT, THOMAS M. DRYSDALE, M.D., IN THE CHAIR.

Dr. D. Longaker read a paper on the TREATMENT OF LABOR IN CONTRACTED PELVES.

The most frequent forms of contracted pelves are the flattened and the generally contracted. In the vis, and cites fifteen cases of such application in former the conjugate diameters alone are shortened, proof of his opinion. After some remarks on estiand in the latter all are less than normal. This paper mation of the conjugate diameter, he concludes with is limited to the consideration of those cases where the following propositions: the narrowing is moderate and not sufficient to renor a little less, and generally contracted pelves hav- presents. ing a conjugate of at least three and one-third inches. Dr. Longaker here followed with a description of the forceps, we have the means of extending still further peculiarities of the flat non rachitic pelvis and the flat the possibilities of successful delivery when the head

had failed. The mother ultimately recovered. A inches premature labor should be induced. careful study of the change from a vertex to a brow Case 4. died twenty-four hours after delivery. Rupture of [Reports from Dr. Cushing's patient as late as the uterus and vagina were found at the autopsy. March 10 show that she is still entirely free from Three other cases of uterine lacerations in breech mental derangement and excessive sexual passion.] presentation in contracted pelves were given, and after a study of the mechanism of this tendency to laceration he came to the conclusion that it will be best to restrict version to cases in which there are other reasons for it than the mere existence of flattening-some of these being the presence of the occiput on the smaller side of an unequally contracted pelvis, the saggital suture over the symphysis pubis, presentation of an ear and prolapse of the cord. He extols the axis-traction forceps in these cases, and exhibited an instrument of his own devising, which he had used in two cases. He has no hesitation in applying the forceps high up in the uterus when the head is arrested at the brim of the pel-

LETTER FROM PARIS.

(FROM OUR OWN CORRESPONDENT.)

Antiseptic Pulmonary Medication—Pathogenesis of Renal Congestion—Hypnotic Anasthesia.

In a lecture on "Antiseptic Pulmonary Medication," recently delivered, Prof. Dujardin-Beaumetz says, that antiseptic pulmonary medication, cines which are eliminated by the lungs. It was with such as it may be imagined in an ideal manner, constitutes the most important therapeutic measure for Dr. Bergeon has proposed rectal injections of sulphopulmonary affections. The air being the greatest hydric and sulphurous acids, having carbonic acid for factor of the contagiousness of diseases, if one could the vehicle. The medicinal inhalations consist of succeed in removing from it the infectious germs iodine, iodoform, eucalyptol, corrosive sublimate, which it contains, one would have rendered the greatest service to medicine and to hygiene. Thanks to ing should be prescribed. Besides inhalations against the interesting researches of M. Pasteur, and to the patient investigations of Dr. Miquel, we know the number of microbes contained in a limited volume of air, and we know that the greater part of these microorganisms are aerobies, that is to say, they require oxygen to live and develop. Whilst on the summit of Hospitals on the mechanism of the pathogeny of of Mont Blanc, microbes are rarely found in the air, in cities, on the contrary, they abound, and their number varies according to the place. Thus, at the functions of the kidneys, which in consequence do park of Montsouris (which is one of the most elevated positions in Paris, one finds only fifty-one mi-through. These latter, not being eliminated, intoxcrobes to each cubic metre, in the Rue de Rivoli, a icate the patient at different degrees, according to street that runs along the buildings of the Louvre, the Palace, and the garden of the Tuilleries the number amounts to 680 for the same space, and they are found still more numerous in the confined air of the hysterical woman, easily hypnotized. She was habitrooms of apartments and in the wards of hospitals. In a bed-room in the Rue Monge, in the neighborhood of the Jardin des Plantes, they attain the figure of 5,260, but in the wards of the hospitals they literally swarm, for in one ward alone in La Pitié Hospital 28,000 to the cubic metre were found.

Attempts have been made to prevent the penetration of microbes into the breathing passages, and several works have been published on the subject. It is true that by a happy arrangement, man breathes only accidentally by the mouth, and that air penetrates particularly by the nasal fossæ which, by their then desired by him to allow him to open the abanfractuosities, pretty well represent the arrangement of the filtering balloons employed by Pasteur for purifying the air. But this filtration is evidently often incomplete, as it is by the pulmonary passages that sleep, the abscess was incised, the skin having been contagious and infectious maladies are transmitted. Among the antiseptic gases, the author places at the head of the list sulphurous acid, basing his theory on the experiment that a dose of 20 grammes per cubic meter, sulphur destroys micro organisms plunged in a liquid, and that a dose of 40 grammes destroys a single complaint. She then expressed her astonthe same micro organisms in a state of desiccation; ishment that after so much suffering the surgeon but unfortunately this gas is not respirable.

The discovery of the microbe of Koch in 1882, to which must be joined the more recent one of the microbe of Friedlander in pneumonia, indicates the therapeutic measures that should be adopted for the future, which consist principally of two; the one by which we should endeavor to oppose by medicinal

means the multiplication of bacilli, and the other by which we should endeavor to modify by hygienic means the culture soil of these same bacilli. Prof. Germain Sée, in his work on bacillary phthisis has, since the discovery of Koch, insisted on the direction which the therapeutics of tuberculosis should take, and the conditions which the anti-virulent agent which he calls "necrophytic" should fulfil, to attain the object proposed. To the first group of these agents belong principally medicinal inhalations, and medithis idea the elimination by the pulmonary surface, carbolic acid, in a word the antiseptics the least irritatphthisis, Listerian sprays have been employed in this affection. The lecturer considers the latter inferior to inhalations, as it was only exceptionally that the sprays penetrate into the interior of the lungs.

In a recent communication to the Medical Society renal congestion, Dr. Albert Robin reported two cases which led him to conclude that cold excites the reflex not allow the waste tissues of the organisms to pass the duration of the suppression of the functions of the kidneys. Dr. Pitres recently presented at the Anatomical and Physiological Society of Bordeaux a ually hemian: esthetic on the right side, the left side of the body having preserved its normal sensibility. The patient was affected on the left thigh with an abscess caused by a subcutaneous injection of morphia. The tumor was fluctuating, and the surrounding parts were considerably inflamed and very sensitive, so much so that it was impossible to touch the abseess without causing great pain, in consequence of which the patient refused to allow it to be opened. She was then put to sleep by the operator simply fixing his eyes upon her (hypnotic sleep), she was scess without feeling any pain after being awakened, even if a bistoury should be plunged into the skin. The patient was then awakened from her hypnotic cut through layer by layer. A claret wine glassful of a thick, creamy reddish colored pus escaped. The edges of the wound were strongly pressed to evacuate the pus. During the whole of the operation, the patient looking at the surgeon with a smile, never offered should have been able to open the abscess without causing her any pain.

DOMESTIC CORRESPONDENCE

VAGINAL TAMPONNEMENT-GALVANIC MEASURE.

Dear Sir:—I beg the privilege of your pages for the correction of some statements which have of late. appeared in various numbers of THE JOLENAL, as they concern subjects in which I am especially in-septic application to the tissues I know of nothing terested, and which I believe to be of great practical better than pure bismuth (subnitrate); this is a most importance.

sue of March 27, 1887, Dr. Etheridge, in an article best material to keep the tampon sweet, better than entitled "Antiseptic Tamponnement of the Vagina iodoform, and without odor of any kind. Tampons in Pelvic Inflammation," page 344, conveys the idea so prepared may remain in place two or three, even that in my "Dry Freatment," I use medicated cetton four days, without becoming in the least offensive. throughout for all conditions, and very correctly says. I trust that this explanation and my coming paper in that he has found considerable satisfaction from the the American Journal of Obstetrics will do away with use of iodine, tannin, iodoform and other prepared any lingering belief that I have urged the medicated cotton tampons in the treatment of pelvic inflamma- cotton for aught but medication, or for use as the tion. Thinking that he had followed out my plan he tampon body. failed, as he naturally must do as he understood it, and he has now found the antiseptic wool to be the ous statements in regard to electric dosage in The material for tamponnement in inflammatory condi Journal of February 5 and February 12, 1887, tions. He is perfectly correct, and as others may which may mislead greatly and which reflect very have misunderstood my suggestions as Dr. Eth unfavorably upon American electro-therapy if aleridge has, and may for this reason condemn the lowed to stand uncorrected. "Dry Treatment," I will here reiterate what I have again emphasized in my paper on "The Details of ampère.—Apostoli has never used and never claimed the Dry Treatment" to appear in an early number of to have used currents of such intensity. I presume the American Journal of Obstetrics, viz: that for all that Dr. Cutter intended to say that Apostoli had purposes of support, rest and compression an elastic used 125 and 150 milliampères, which is about one-material, non-compressible, non absorbent, must be used eighth and one-seventh of one ampère. If Dr. Cutter's for the tampon. I use finely carded sheep's wool or battery measured 27 to 30 ampères, this does not tell jute, with long and fine fibre, advocating plain, ordi- us the intensity of the current actually used upon nary cotton when these are not to be had, never pre- the patient, as the resistance of tissue and electrodes object in view.

It is natural that when support, rest, or, in inflammatory cases, compression of vessels is desired, the tells us that he has used from 25 milliampères to 10 medicated and absorbed cotton tampon is useless, ampères through a fibroid tumor, with one surface as it soon mats and is compressed into a firm doughy electrode, and without causing pain enough to require wad. In such cases I apply my remedy in the form an anasthetic. Ten ampères, 10,000 milliampères of an outer covering layer of medicated cotton would search the body as would a stroke of lightover the elastic jute or wool tampon, and medicated ning. This is impossible. I am glad to see that Dr. cotton alone; for the entire tampon I rarely use, Martin is seeking to define and record his treatment only in cases where medication solely is desired, and more accurately, and that he is resorting to currents neither support nor compression. The elastic wool of higher intensity. It is a satisfaction to me to see or jute tampon coated with medicated cotton has a that he has accepted my criticism of his paper which double advantage over the tampon solely of wool; I made before the Section on Obstetrics and Disit assists pressure by medication, and it brings a cases of Women, at the St. Louis meeting of the softer surface in contact with the vaginal tissues, in American Medical Association, in 1886. place of the wool, which, when used alone, I have urged the importance of the galvanometer, and the seen to cause discharge by irritation of the parts by necessity of exact measurement, strong currents and

on the new antiseptic absorbent wool, that for general use of high intensities, in three and four sittings. use, for the elastic tampon basis I decidedly prefer that we want, and the quality is deteriorated by the skin and destroy the activity of the nerve tissue.

process of preparation; the wool is rendered less effective for the very purpose by preparation. It is the oily, fatty matter which prevents absorption and keeps the fibre clastic, hence I prefer the natural wool, if of good quality, or the jute to all absorbent preparations. I render the tamponnement antiseptic by the powder with which I dust the tissues or which Linclose in the wool, jute or cotton, and as an antiagreeable, soothing application to the vaginal walls, First, as regards the vaginal tampon: In your is- a sedation, a most excellent absorbent, and the very

Secondly, I wish to call attention to some errone-

In No. 6, February 5, 1887, page 167, Dr. Cutter so often stated, what I constantly teach, and what is says that Apostoli uses currents of 1.25 to 1.5 pared cotton. The medicated cotton I employ merely is not given, and the battery-strength alone does not as a covering, more or less thick, according to the afford any clue as to the strength of current effectively engaged in action on the diseased part.

In No. 7, February 12, 1887, page 195, Dr. Martin short sittings, if electricity were to be made service-I will moreover add, as Dr. Etheridge lays stress able in practice, recording successful cases with the

Dr. Martin's later papers prove him a convert, but the plain finely carded wool: the material I obtain he is seriously at fault somewhere. No man ever is whiter, finer and of longer fibre, and more elastic has or ever will pass ten amfères (10.000 milliamthan the prepared absorbent wool. It is elasticity peres) through living tissue, as this would scorch the

The scientific world was astounded when Apostoli employed 100 milliampères, which he has increased to a possible 250 milliampères (I have even used 280 milliampères with one surface electrode), but this is MEDICAL AND SURGICAL MEMOIRS: Containing Ina current of utmost intensity with surface electrodes. If we use both poles within the tissues of a part meagrely supplied with nerves, we may use higher intensities, but not with surface electrodes and without aniesthesia. The use of ten ampères with one surface electrode, and without giving excessive pain and burning the integument, is simply impossible, and I feel that the error must be corrected, in order that those desiring to follow may not be lead into mischief, and that foreign operators may not lose faith in American reports.

I have waited so long with this correction, as I had expected some explanation from Dr. Cutter or Dr. Martin in one of the following numbers; but as no statement has appeared, I beg you now to insert this. Very respectfully yours,

GEO. J. ENGELMANN, M.D. 3003 Locust St., St. Louis, Mo., March 31, 1887.

HAY ASTHMA IN A CHILD EIGHT YEARS

"Hay Fever," because I have not seen any case re-

ported in a subject so young.

Helen O., farmer's daughter, aged 8 years, has been troubled with hay asthma from the middle of June until September, every year since she was 3 years old. During the remainder of the year she is free. During the summer the symptoms are constantly present, worse at times, especially in going into a meadow or cornfield, and her nights are a torture because of her inability at this season to sleep, the dyspnœa being so great. The patient has two aunts in Vermont who suffer from the same malady, and only get relief by going every year to the White Mountains.

When she first presented herself to me, June 22, 1886, she had been suffering for about one week. Her breathing was truly asthmatic, face flushed, nasal passages were obstructed, eyes red and swollen, and suffused with tears. Her temperature was 100° F. An examination of the nasal passages revealed much tumefaction of the turbinated bodies. After the application of a solution of cocaine, it was seen that the lower turbinated bones on both sides stood away from the outer wall of the passage toward the septum, and on the right side the bone was in actual contact with the septum.

moved a portion of the right lower turbinated bone. This was followed by a vaseline spray, and at intervals of a few days by applications of glacial acetic acid in both nostrils. After the operation repair took place kindly, all symptoms of the disease disappeared promptly and have not yet returned.

Ýours truly,

H. Moulton, M.D.

Stuart, Iowa, April 7, 1887.

BOOK REVIEWS.

vestigations on the Geographical Distribution, Causes, Nature, Relations and Treatment of Various Diseases. 1855-1886. By Joseph Jones, M.D., Professor of Chemistry and Clinical Medicine, Medical Department of Tulane University of Louisiana; Visiting Physician of Charity Hospital; Honorary Fellow of the Medical Society of Virginia, etc., etc.

Volume II. Containing Researches on the Origin and Effects of Epidemic, Endemic, Infectious and Contagious Diseases; Investigations on the Nature, Causes, Relations and Treatment of Malarial (Paroxysmal) Fever, Intermittent, Remittent, Pernicious and Hæmorrhagic Malarial Fevers; Comparative Pathological Anatomy of Malarial, Typhoid and Yellow Fevers; Indigenous Remedies of the Southern States; Albinism in the Negro Race; Oriental Leprosy; Elephantiasis Græcorum, Elephant's Leg (Elephantiasis Arabum). New Orleans, La.: Joseph Jones, M.D., 156 Washington Averue. cor. Camp Street, Fourth District. 1887.

Such is the title of a ponderous volume of more Dear Sir:—I wish to report the following case of than 1,300 pages, copiously illustrated, and containing a large part of the results of a lifetime of untiring, methodical, yet varied and intelligent observation and research. The first volume of Dr. Jones's Medical and Surgical Memoirs was published in 1876, and was occupied largely with the results of his studies and observations concerning diseases of the nervous structures of the body, the various morbid conditions of the blood, pneumonia, etc. It embraced 820 closely printed pages, constituting a most valuable storehouse of facts hardly to be found elsewhere.

The second volume, just issued from the press, is printed on good paper, plain type, with many fairly well executed plates, and substantially bound. It is not a systematic treatise on practical medicine, or on any special department of medicine, but is rather an aggregation of the author's studies and observations concerning a large number of most important diseases, accompanied by the results of long continued original researches, not only at the bedside of the sick, but in the morgue and the chemical and microscopical laboratories, and is consequently a storehouse of etiological, histological and pathological facts of great value. Even a brief analysis of the contents of this extensive work would occupy more time and space than we can give, but the reader may form some idea of their nature and importance On July 1, with the nasal cutting forceps, 1 re- from the general heading of the several chapters as follows:

Elephantiasis Arabum, elephant's leg, Barbadoes leg.

The volume is illustrated by 127 engravings, some of them colored. For more than thirty years the author has been actively engaged not only in the general field of practice, but also in the special de- ELEMENTS OF OBSTETRICS for Physicians and Stupartments of hospital, sanitary, and military work, and has at all times brought to his aid in the investigation of the causes, nature and results of disease a thorough knowledge of analytical chemistry and of microscopy. His original researches have not been undertaken for the purpose of rectifying or refuting the theories or discoveries of others, but rather for

diseases—210 pages. Chapter 3. Comparison of its cost, if for no other purpose than as a work of to the etiology, pathology, therapeutics and prophyreward for the sale of so valuable a work.

> M.D., LL.D., F.R.S., F.R.C.S., Professor of Forensic Medicine, King's College, London, etc. Second edition, re-written and enlarged, with numerous illustrations. 8vo, pp. xx 498. New York: G. P. Putnam's Sons.

Our welcome of the masterly work of Professor Ferrier is none the less hearty if it has been delayed so long. It would only be expected that the second edition of the work, published ten years after the first, would be in many respects a very new and much changed work; and such is the case. It was looked upon, from the first, as a thoroughly original work, with nothing of the too frequent mechanical compilation about it. The great advances made in the last few years in the diagnosis of lesions of the brain, and in the surgery of the brain, make such a

The title of the work does not comprehend its entire scope. Including the medulla oblongata, the

A general review of the book may be regarded as 12. Leprosy, elephantiasis Græcorum. Notes on unnecessary. Dr. Ferrier is already almost as well the history of leprosy in the Southern States. Chap-known to Americans, and his work as much respected we think it quite sufficient to notice the appearance of the second edition of this work.

be settled by men who have half a dozen cases of Kharkov Medical Society has received from the Kürsk midwifery during a year.

Government Assemply 1,500 roubles (about \$750) to

The discussion of the pathology of pregnancy, labor and child bed, occupy almost 300 pages, and is thorough. The remainder of the book is devoted to obstetric operations. The whole work is singularly free from the redundancy and unnecessary wandering off into minor details, the positive verbosity in fact, which is frequently characteristic of German writers, and unlike most foreign books it has a good index. One gets and retains the idea all through that the author wrote it because he had something to say, not because he simply wished to write something.

MISCELLANEOUS.

ILLINOIS STATE MEDICAL SOCIETY.—The thirty-seventh annual meeting of this Society will be held in the Methodist Church Block, corner of Clark and Washington streets, Chicago, commencing on Tuesday, May 17, at 10 o'clock A.M. All regular City, County and District Medical Societies in the State are entitled to one delegate for every five of their resident members.

The following standing and special committees are

expected to report:

On Practice of Medicine—Daniel R. Brower, of Chicago, A. K. Vanhorn, of Jerseyville, and P. H. Oyler, of Mt. Pulaski.

On Surgery—D. A. K. Steele, of Chicago, C. Goodbrake, of Clinton, and B. F. Crummer, of Warren.

On Obstetrics—Ellen A. Ingersoll, of Canton, C. DuHadway, of Jerseyville, and W. H. Conibear, of Morton.

On Gynecology—Otho B. Will, of Peoria, J. M. Armstrong, of Evansville, and Catherine Miller, of Lincoln.

On Drugs and Medicines—J. G. Tapper, of Elgin, T. M. Cullimore, of Jacksonville, and Maria J. Mergler, of Chicago.

On Ophthalmology and Otology—S. J. Jones, of Chicago, A. E. Prince, of Jacksonville, and C. R. Parke, of Bloomington.

On Diseases of Children - Geo. W. Jones, of Danville.

On Physiology—A. Wetmore, of Waterloo.

On Dermatology—H. J. Reynolds, of Chicago.

On the Diseases of the Throat and Nose—E. Fletcher Ingals, of Chicago.

On Hydrophobia—Geo. N. Kreider, of Springfield, and others.

President—Elias Wenger, of Gilman.

Permanent Secretary—D. W. Graham, of Chicago. Chairman of the Committee of Arrangements— Ephraim Ingals, of Chicago.

BACTERIOLOGICAL LABORATORIES IN SIBERIA AND RUSSIA.—The Medical Society of Irkutsk, the capital of Eastern Siberia, will soon have a "bacteriological station" in the little city of 40,000 inhabitants. The

Kharkov Medical Society has received from the Kürsk Government Assemply 1,500 roubles (about \$750) to establish a bacteriological laboratory in Kharkov, and will receive 700 roubles yearly to support the laboratory.

MISSOURI STATE MEDICAL ASSOCIATION.—We are informed by Thos. B. Jackson, M.D., Chairman of the Committee of Arrangements, that the next annual meeting of the Association will be held in Macon, Mo., May 10, 11 and 12. A full attendance is expected.

HEALTH IN MICHIGAN.—For the month of March, 1887, compared with the preceding month the reports indicate that erysipelas, measles, tonsilitis, and consumption of lungs increased in prevalence. Compared with the preceding month the temperature in the month of March, 1887, was slightly higher, the absolute humidity and the day ozone were about the same, the relative humidity and night ozone were less. Compared with the average for March in the nine years, 1879-1887, measles and erysipelas were more prevalent, and remittent fever, intermittent fever, pnenmonia, scarlet fever, influenza, bronchitis and diphtheria were less prevalent in March, 1887. For the month of March, 1887, compared with the average of corresponding months for the nine years 1879–1887, the temperature was lower, the absolute humidity and the ozone were about the same, the night ozone slightly less.

Including reports by regular observers and others diphtheria was reported present in Michigan in the month of March, 1887, at forty-six places, scarlet fever at fifty-two places, typhoid fever at thirteen places, and measles at thirty-five places. Reports from all sources show diphtheria reported at twelve places more, scarlet fever at ten places more, typhoid fever at three places less, and measles at eleven places more in the month of March, 1887, than in the pre-

ceding month.

TREATMENT OF FIBROID TUMORS OF THE UTERUS BY ELECTROLYSIS, WITH A DESCRIPTION OF APOSTOLI'S METHOD.

Read before the Chicago Medical Society, Dec. 20, 1886. BY FRANKLIN H. MARTIN, M.D.,

PROFESSOR OF GYNECOLOGY IN CHICAGO POLICLINIC, CLINICAL LEC-TURER ON GYNECOLOGY IN SOUTH SIDE DISPENSARY, CHICAGO , FELLOW OF CHICAGO GYNECOLOGICAL SOCIETY, ETC.

Unfortunately, the term "electrolysis," as applied to the treatment of disease, has been by many, for some unaccountable reason, greatly misunderstood. of treatment by electrolysis, the term has become of fibroid tumors of the uterus, because it does not synonymous with any form of electrical application, whether of the galvanic, faradic or static variety. However, to facilitate a description of my method of This is a mistake. To successfully treat any partic-treatment, I will make the old division according to ular diseased condition by electrolysis, certain scien- location into, 1, submucous; 2, interstitial; 3, subtific principles are involved, that are as necessary for peritoneal. The nomenclature of this division suffius to understand as it is for an inventor to understand ciently explains itself. To still further expedite matters, certain scientific principles before he can successfully allow me to divide these tumors according to their construct an electric motor.

of the current must be at hand.

stant galvanic current, which do not properly come under the head of electrolytic action, but which are utilized in the treatment of fibroid tumors. I refer, 1, to the cataphoric action of the current; 2, to the local effects of the two poles.

The subject of the treatment of fibroid tumors of the uterus by the continuous galvanic current, therefore, presents the following points for our considera-tion: r. The tumor. 2. Means for generating a continuous current of electricity. 3. Means of measuring or gauging the current. 4. Electrolytic action of the current. 5. Cataphoric action or electrical osmosis. 6. Local effect of the poles. 7. The

apparatus and general detail.

I. Consideration of Tumors.—I will not go into a Because an electric battery is one of the requisites long discussion of the history, causes and pathology particularly bear upon the subject of the evening. condition, into the hæmorrhagic and the non hæmor-Electrolysis is simply an expression for an electrical rhagic. By hæmorrhagic we will include those tumors

II. The Current.—The current of electricity used through the electrolyte. And unless we have prese in electrolytic therapeutics should be one of moderate ent in every case upon which we operate these requi-quantity compared to the intensity. It should be sites, and bring them into such relationship that the very uniform and without interruption. The direcelectrical current conveyed through the electrolyte tion of the current should always be known. Any by means of suitable conductors will dissolve the means of generating electricity that will be practimolecules of the electrolyte into their constituent cable, and at the same time answer the above requirements, will be suitable for our purpose. I have So far as the phenomenon electrolysis has been found nothing better than some form of the chemutilized in medicine, it has been for the purpose of ical battery. In the beginning of my work with removing abnormal tissue. In order to accomplish electrolysis I used some form of the ordinary zinc this, certain other requisites are necessary. 1, the and carbon battery with a solution of dilute sultissue to be dissipated must be an electrolyte or con-phuric acid and bichromate of potash. For purposes tain electrolytes; 2, the tissue must be in a position of epilation, strictures of the urethra and uterine where it may be electrolysized without endangering canal, and other of the smaller operations, this batneighboring tissues; 3, its surroundings must be such tery answers the purpose admirably, where it is propas will favor the removal of the ions by absorption erly cared for. For accomplishing more decided or otherwise, that have been freed by the electrolytic work, however, this variety of battery becomes imaction; 4, some means of ascertaining the strength practicable, because of the labor required to keep it in proper order. The results of my experiments have Before considering the above points more in detail, led me to adopt for office purposes the ordinary crow-I wish to refer to two other phenomena of the confoot gravity cell. This cell is furnished to me by the

These rience and knowledge, is about 1,000 milliam icres. cells are coupled in tandem, and connected with a To get this power I use a battery composed of 115 selective switch board arranged in such a manner gravity cells.1 that any number of cells from any part of the battery. can be brought into the circuit. A large number of in causing the absorption of fibroid tumors or any these cells can be placed in a closet or other con-other pathological growth, is not a new phenomenon venient place and attached to the switch-board by in electro-chemistry. This action has been utilized means of a cable of wire. The storage battery can in the commercial world for a number of years, and be utilized for this purpose, but is as yet impractilits value is constantly increasing. The same princil cable for long and constant work. The dynamo has ple that is used in electro-plating can be made value. been suggested, and will without doubt, with time able in medicine, in relaxing the loosely combined and improved motors, take the place of all other elements of a fibroid tumor and causing their deposit forms of generating electricity for office use, both for where they will be carried from the system. cautery and, with proper resistance coils, for electrolytic work.

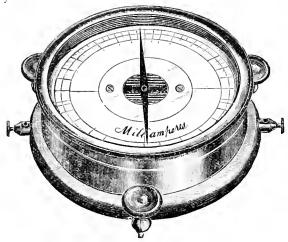

Fig. 1.-McIntosh's Milliampère Metre.

111. Measurement of Current.—With the advance in electrical therapeutics we have found it necessary to adopt some means of measuring approximately the strength of current employed. Especially is this desirable when the enormous strength of current is its osmosis into the surrounding absorbents, and used that is necessary in the treatment I am describ-thereby accomplishes its removal. ing. It is unwise to employ a current of more than 25-milliampère strength through the vital tissues of the battery is very different with a high tension curthe body, without being in a position to watch every rent. The effect of the positive pole is termed by variation of intensity, and this can only be determined. Dr. Apostoli the galvano caustique effect of the posiwith accuracy by the employment of a galvanometer tive pole. This is an action of a great deal of im-(Fig. 1). I take pleasure in being able to exhibit a portance, and from which a great advance is contrigalvanometer to the Society this evening that answers buted in the treatment of hæmorrhagic fibroid tumors all requirements for therapeutic purposes. This in- of the uterus. The phenomenon is obtained only by strument was constructed, after a large amount of the employment of a very strong current, from 50 to work and experimentation, by Dr. McIntosh, of the 1,000-milliampère strength, and concentration of this McIntosh Galvano Faradic Co., of this city. It has current at the point of contact of the positive pole been graduated in the presence of an absolute gal- of the battery to the tissues. This electrode must be vanometer, and each instrument that is constructed of small size, and of some unattackable metal. The is graduated by actual comparison in the same way, effect obtained upon vascular tissues or mucous mem which is a point that is absolutely necessary if accu | brane by thus concentrating the current is to produce racy of measurement is to be obtained. Many of an eschar. This eschar, however, if the current has the galvanometers that have been thrown upon the been proper, will be found to be simply a coagulation market of late, for medical purposes, have been little and a hardening of the mucous membrane and the better than worthless. This instrument is graduated tissues beneath it for some little distance. This profor milliampères, and will measure accurately a cur- cess of contraction and coagulation modifies the tent from 1 to 1,000-milliampère strength.

The maximum current that can be safely passed through the body, consistent with our present expe | rents in special ca

IV. Electrolysis, the principal action that we seek

A strong current of electricity is passed through a growth of this character, and in its substance it finds many electrolytes which are dissolved into their constituent elements. These elements, according to their electrical tendencies, travel toward the negative or the positive pole of the battery, and may be disposed of in the following four ways: 1. "Many of them immediately make similar or dissimilar combinations with neighboring elements of opposite electrical tendencies, making thereby new compounds which act as foreign particles; as foreign bodies they are promptly removed by the nearest absorbents. 2. Other elements, as they become free from their original inal molecules, make combinations with elements which are already leaving the tissues through one of the innumerable minute vascular canals. 3. Many, in the form of gas, pour into the atmosphere beneath and surrounding the electrodes. 4. Others attack the electrodes and are disposed of in the form of deposit on their surfaces."

The cataphoric action of the galvanic current should also be recognized as playing its part in the promotion of absorption. It is by this property that fluids are determined in mass from the positive to the negative pole. This action, in producing an unnatural turgescence of fluid at the negative pole, favors

The local effect of the current at the two poles of calibre of the vessels of the circulation so that hæm-

¹ Since writing the above I have been able to use still higher cur-

orrhages are less liable to occur at the point of applies oft metal, of appropriate dimensions, has loosely cation; at the same time it does not destroy the stretched over its concavity an animal membrane circulation sufficiently to produce strangulation and which is fastened to its circumference securely enough death of the part. There is nothing that will so effectually stop all forms of excessive hemorrhages or leucorrheea, without producing a troublesome slough, and a subsequent contraction, as this partieular application of electricity when made to the mucous membrane of the uterus.

The local effect of the negative pole is the opposite of that of the positive when the current is strong and concentrated. The action of this pole is one of liquefaction instead of hardening and coagulation. Its eschar resembles much that of a caustic alkali.

V. The Electrodes used in the treatment of fibroid tumors by Dr. Apostoli's method are few in number. Two electrodes are always necessary at every operation. One of these is applied externally on the active one. This is either a sound that fits accurately surface. the uterine canal, or a pointed electrode which enters sound, platinum and iridium when in form of needle. all irregularities, covers a large surface, and causes a

VAGINAL PRESSURE IN THE TREATMENT OF ·CHRONIC PELVIC DISEASE.

Abstract of a paper read before the Chicago Gynecological Se- follows: ciety, February 18, 1887.

> BY A. REEVES JACKSON, M.D., OF CHICAGO.

The brief paper which I have to present this eve- metamorphosis. ning, was suggested by some remarks, with which the society was favored at its last meeting by Dr. Etheridge, entitled a "Preliminary Note on Autiseptic Tamponnement of the Vagina in the Treatment of treatment, and determined to give it a trial. the past eight or nine years.

reading a paper which was published by Dr. V. H. that have been made concerning its efficacy. Taliaterro, of Atlanta, Ga., in 1878, on "The Ap-1" Dr. P. F. Munde, who gives an abstract of Dr. The method consisted in firmly packing the vaginal tonitic or cellulitic exudations and adhesions." pressure and moisture.

the tumor necessitates many operations, varied, of treatment. Dr. Jackson detailed a number of instruccases simply a restoration to health and a relief from of these, the patient was suffering from supra vaginal the prominent and annoying symptoms must be accelelongation of the uterine cervix, complicated with complete cystocele and vaginal eversion, the invo-10. The time of commencing the treatment mat-; luted parts protruding from the vulva and forming a The uterine canal and no excessive hemorrhage is present. The op- measured six inches. The parts were restored and eration should be inter-menstrual, if possible, but if the vagina packed with cotton, a process which was hæmorrhage is continuous operate during the flow, repeated every two or three days for a fortnight, at The séances should occur two or three times a week the end of which time the depth of the uterus was if compatible with the endurance of the patient, and reduced to three inches. Other symptoms were correspondingly improved. The patient, who had been 11. Extra uterine puncture should be regarded only able to drag herself along with pain and diffionly as a last resort, but every means of reaching the culty, could, after the first packing, move with rapidtumor through the uterus being impracticable, seek, ity and comfort. She was subsequently cured by a if possible to make the operation extra-peritoneal, plastic operation on the vagina. A number of other should this in turn prove equally unadvisable, use as cases, some of them furnishing results almost equally striking, were detailed by the writer.]

Dr. Taliaferro strongly emphasized the importance precautions are absolutely demanded in operations of applying the tampon with the patient in the Sims' position, in order that the vaginal canal should be distended and elongated to its utmost capacity. He further advised that the first few pieces composing the tampon should be of cotton, for the reason that a greater amount of glycerine may be incorporated with that substance than with wool. It was claimed that the therapeutic effects of this treatment are as

1. It diminishes blood supply and nutrition.

2. It promotes absorption.

3. It removes hyperplastic tissue by retrograde

4. It diminishes nervous action.

It rectifies malpositions.

I was much impressed by the stated results of the Pelvic Inflammation." It would have afforded me seemed to promise a valuable substitute in some of pleasure to endorse the treatment which was advo- the objectionable and uncertain methods of local cated at that time, had an opportunity been given treatment then and now in vogue, such as cauterizafor so doing, for 1 have had occasion to make fre-tion, local blood letting, tents, intra-uterine medicaquent use of it, and to learn its advantages, during tion, iodine painting, hot douches, etc. Since then I have used it in many cases of chronic pelvic disease, My attention was first called to this subject by and am able to corroborate the favorable statements

plication of Pressure in Diseases of the Uterus," in Taliaferro's paper in his "Minor Surgical Gynæcolwhich the writer presented many facts and arguments ogy," edition of 1885, says: "Of the value of this to prove the great therapeutic efficacy of the princisteady and elastic pressure and support in reducing ple of pressure as applied to the treatment of diseases—the size of an engorged hyperplastic or (better still) of the uterus and other pelvic organs, which are subinvoluted uterus, and restoring the normal circucharacterized by habitual passive congestion and its lation to the ædematous and congested pelvic celluresults, namely, uterine displacements, enlargement, lar tissue, I have no doubt whatever; neither of the relayation, cervical crosions, menstrual disorders, etc. potent alterative effect of this pressure on old peri-

with sheep's wool made antiseptic with carbolic acid, I had not applied this dressing many times before with the aid of a Sims' speculum, the patient being 1 observed occasionally on removing the tampon, in the knee-chest posture. At first Dr. Taliaferro that on various parts of the vaginal wall, and also used cotton pledgets, saturated with glycerine, but around the os uteri, erosions appeared sometimes observing that the cotton packed quite hard, he bleeding slightly on exposure. I attributed this to very soon substituted wool because of its resiliency, the fact that the packing had either been too firmly or a quality with which it was found to retain under unequally placed. In cases of moderate laceration of the cervix uteri, this accident is especially likely [In illustration of the results of this method of to occur if the packing is so applied about the vaginal portion in such a manner as to widely open the os-disparage in the least the use of hot water irrigations, possible.

MOUTH BREATHING AND ITS TREATMENT.

BY N. R. GORDON, M.D., OF SPRINGFIELD, ILLS,

The evil results of mouth breathing, are due to the inspiration of atmosphere at a low temperature, the presence of dust and foreign matter in the air, the desiccating effect on the mucous membrane over which the air passes, and the disuse of the nasal passages for the normal function of respiration.

The pathological results are: chronic inflammation of the pharynx, larynx, and bronchi, and the adjacent tissues, accompanied with cough, hoarseness, loss of resonance of voice, impairment of sense of smell, and hearing. The pernicious effect of oral respiration is not impressed upon the minds of medical men, nor is it scarcely recognized as being an evil practice by the public. The practice is a very there are a great many habitual mouth breathers.

A condition which gives rise to partial or complete nasal stenosis, is adequate cause for mouth breathing. Chronic hypertrophic catarrh is the most frequent cause of partial stenosis; the frequent congestion of the cavernous tissue from repeated colds, causes hypertrophy of the turbinate bodies, which partly close the nasal lumen, requiring the subject breathing is in proportion to the nasal stenosis; the transition from nose breathing to mouth breathing is but upon taking exercise such as walking, they resort to mouth breathing to supplement the deficiency in the nose; others resort to it only during sleep; for the cure of mouth breathing will depend upon of thickened mucosa.

ostosis of vomer may produce partial or complete require removal by the galvanic cautery or Jarvis' stenosis of the nares; foreign bodies, such as seeds, wire snare.

tion was resorted to is very small in comparison with buttons, stones, may lodge in the meati, and occlude will prevent nasal breathing.

The function of the nose is of a three-fold character: 1. Respiration. 2. Special sense of smell. 3. Vocal resonance. The temperature of the air, in its passage through the nose, is increased, and foreign substances, such as dust, is lodged on the irregular mucus surface of the nasal passages. If the inspired air is dry, it also gathers moisture. The terminal filament of the olfactory nerve are very properly distributed to the superior portion of the nasal passages, where it readily comes in contact with the odor bearing atmesphere. In order that the vocal resonance should be perfect, the nasal and postnasal passages should be free and open; any increase in tissue or obstruction in these passages impair the resonance of the voice.

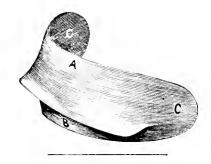

In oral respiration the air enters the larynx at a temperature somewhat lower than is given it by a passage through the nasal chambers; this cold air excites inflammatory action, producing soreress, cough, hoarseness aid other symptoms of pharyngeal, common one, especially during the winter season; laryngeal, and bronchial irritation. The dust and foreign matter floating in the air finds but little to impede its progress until coming in contact with the vocal bands, and the adjacent sensitive tissues, thus adding another factor, in the production of inflammation. Owing to the dryness of the atmosphere in our dwellings, the mucus membrane of the mouth and throat, in its efforts to furnish the required additional moisture, becomes very dry and parched. Infiltrato resort to oral respiration; the necessity for mouth tion with thickening of the mucus, submucus, and glandular tissue, of the entire nasal and post-nasal passages occur, as the result of deprivation of the gradual, and the parts by degrees become accustomed normal stimulus, afforded by respiration; such thickto the transfer of function. Many persons have a ening interferes with the resonance of the voice, hearpartial obstruction of the nasal passages; they breathe ling, and sense of smell. The results arising from with comparative ease while in a state of repose, the loss of nasal breathing, are as important as the direct evils from mouth breathing.

Treatment.—The method of treatment adapted many contract mouth breathing from a careless the cause. If the obstruction is due to deflection of habit, or possibly from a succession of colds in which | septum, I have found the rotating built and dental the subject is forced to breathe through the mouth; engine, the most practical and satisfactory method in such cases the obstruction in the nose is the result of relieving the difficulty. Exostosis can be removed in the same way. Abnormal growths of whatsoever A deflection of the septum to one side or the character, must be removed by such means as seem other, will produce a partial obstruction of the narcs; best adapted to the various conditions existing in the septum may be contorted like the letter S, giving each particular case. The adhesions of the soft a stenotic effect in each nostril; often coupled with palate with the posterior wall of pharynx, should be deflection there is hypertrophy of the opposite tis dealt with in the most approved method for relieving sues, making the stenosis complete. Any of the such conditions; adhesions of the nasal walls should tumors that occur in the nasal cavity, such as the be severed, and pledgets of cotton kept in situ until gelatinous, or mucous polypi, malignant growths, the part heal. At this health resort, where many of the broken the obstruction is not indurated, fixed, or complete, down people of the United States sooner or later and in cases after an operation for the relief of come as to a sort of Mecca for the attlicted. I see Fisher, of this place, to be admirably adapted for except at first. When such patients come with dewithout the aid of bandages or other appliances, and encouraged them to give the remedy a thorough trial, fort. I wish to call especial attention to the value is nine cases out of ten, some form of cerebrasthenia,

The cases of nervous break down which are serious enough to have caused a compulsory vacation from quently require medical treatment to reestablish the habit of sleeping, and thus enable the exhausted The accompanying cut gives a very good idea of nerve centres to be rested and reinvigorated; and no sedative or narcotic drug yet tried by me, whether opium, chloral, the bromides, hyoscyamous, hyoscine or paraldehyde has proved satisfactory in such cases. The tonic effect of the sea air with good food, moderate exercise and cheerful company often prove sufficient. When it does not, a light lunch at bedtime with occasionally a few teaspoonsful of whisky in milk added and the sponging of the body with seawater followed by a thorough rubbing with a Turkish towel are highly useful measures. But sometimes these all fail, and when they do, my experience teaches that to begin administering any narcotic medicine is usually a mistake. My most frequent recourse now is to give some one of the nutrient nerve tonics, such as the compound syrup or glycerite of the hypophosphites—a teaspoonful two or three times a day—or in some cases the compound syrup of the phosphates, commonly known, in Philadelphia at least, as Parish's Chemical Food. When the patient has a weak FORMERLY PHYSICIAN TO THE MERCER MEMORIAL HOUSE FOR INVALID heart and insomnia results from a passive congestion of the brain, a condition frequently met with among One of the lessons strongly impressed upon me by neurasthenics, a little digitalis may work wonders and

MEDICAL PROGRESS.

THE TOXICITY OF THE CHOLERA BACILLI AND THE TREATMENT OF CHOLERA.—Much in the course of cholera, especially in foudryante cases, points to the toxic action of the bacilli. The poison may be after a passage, so that it may be retained as long as derived from the vegetative activity of the commabacilli, may be a ptomaine that has been formed in the than two to six it jections are required a day. Canintestinal canal, or it may be secreted by the bacilli, tani states that during the Naples epidemic he was or the bacilli in themselves may be poisonous, those savitary inspector to the orphan asylum for children that have perished in the intestinal canal being digested and acting in the manner of poisonous mush-first weeks as many as six cholera cases developed a rooms. To determine upon what this toxic action, day which had to be taken to the cholera hospital. depended Cantani, of Naples, by boiling sterilized a He then began to inject the hot tannic solution as three-days pure culture of comma bacilli and injected, soon as diarrheea began to appear, and from this it into the peritoneum and the subcutaneous tissue of time, of several hundreds of orphans admitted to the dogs. The animals sickened with symptoms of chol-linstitution, he had seventy-six cases of mild and thirera and recovered in twenty four hours. Dr. Ducroux is of opinion that the prevent evaporation. Professor Mikulicz's observapatient may be again obliged to have recourse to tions included six resections of joints, four amputa-

tions, six dissections, two ligatures of arteries, seven reaction, therefore, are dependent on the space in extirpations of large tumors, etc. of the fifty cases union took place without suppurain five superficial suppuration starting from the points of suture, and in the remaining cases pus had existed previously to the operation, and the disinfection at the time not having been complete, it continued subsequently. The general condition of the patients was highly satisfactory, even in those cases where suppuration occurred, the temperature in no case rising much beyond normal. The dressings were not removed or changed for at least a fortnight, sometimes not for a month. This appears to be of great advantage in the case of bone and joint operations, where complete immobility of the parts is a desideratum. Other specified advantages attributed to this plan are that wounds attended with a loss of substance rapidly fill up, and the cicatrices that form are peculiarly soft and smooth. Professor Mikulicz does not find, as Schede did, that the existence of silver sutures in osseous lesions has any unfavorable influence on the cicatrization of the wound. He remarks that it is important not to bind the external dressings too tightly to the wound.—Lancet, March 19, 1887.

"DEAD SPACE" IN CERTAIN CHEMICAL REAC-TIONS.—The most important discovery now spoken of in Berlin medical society is that of Prof. Lieb-REICH, who only a year ago presented us with the new basis for ointments. His latest discovery is more in the sphere of pure chemistry, but it is also interesting to physicians. Professor Leibreich observed that when reaction takes place only some time after mixing certain liquids together, it does not occur throughout the whole liquid; in some parts a space is left, in which no reaction is seen, and this he calls the "dead space." He has observed the same in several reactions—for instance, on mingling sulphuric acid, iodic acid, and starch together, or hydrate of chloral with carbonate of sodium, or chloride of gold, sodium lye and sugar, and in many other cases. The so-called "dead space" is not always the same, but varies according to the kind of vessels into which the liquids are poured. If, for instance, narrow tubes are used, the "dead space" is very small, while in capillary tubes no reaction whatever takes place. If the liquids are poured into closed vessels with above mentioned liquids is poured into it. in each of less, but positively dangerous.—Lancet, April 2, 1887. the compartments the reaction is seen taking place in the middle, while at the top and bottom there is a "dead space." As the "dead space" depends upon Emesis.—Респоллен uses liquified carbolic acid 5ij, the size of the vessel, it may be inferred that for every acctum opii 5vj, gtt. 4 in sweetened water t. i. d. five chemical mixture yielding a reaction, proportions can or ten minutes before meals.—Therap. Monatshefte, be imagined in which reaction ceases. The laws of March, 1887.

In thirty-six which the effect takes place, and hence, these observations have an important bearing on the organism. tion, in four there was extensive formation of pus, In testing the effect of certain medicinal agents, not only must their chemical constitution be taken into account, but the laws governing their reaction in large and small spaces respectively.—British Medical Journal, January 8, 1887.

> Adonis Vernalis in Heart Disease—Dr. J. G. HERRMANN, of St. Louis, writes that he has recently had considerable experience with the use of adonis vernalis in cardiac affections. He believes that his experience, which has extended over ten months, warrants his statement that, while free from the evil effects of digitalis, infusions of adonis vernalis are quite as efficacious as that drug. He prescribes it i the form of an infusion, of the strength of three drachms of the herb to six ounces; of this he gives a tablespoonful every two hours. He refers to several cases in which this drug proved successful even after digitalis had failed. One was a case in which the feet were highly cedematous, and there was general anasarca from heart lesion. In two weeks of treatment with the infusion of adonis vernalis every two hours, in tablespoonful doses, almost perfect relief was secured. So also he states that he has caused great relief to a case of ascites, produced through heart disease. He noticed that it increased the fulness of the pulse and strengthened the cardiac pulsation. In asthma also he has combined it with quebracho with very satisfactory results.

The following are some of the prescriptions which

he has employed:

A NEW PATHOLOGY OF PREGNANCY.

In the March and April numbers of the American one side of the woman's spine. Journal of Obstetrics, may be found a most interest-

presentation (commonly known as a transverse pre- mal for primiparæ as well as multiparæ.

sentation). A head presentation (presentation of the head towards the centre of the canal of the pelvis and os uteri, with the long axis of the child parallel with the axis of the plane of the pelvic brim) is therefore abnormal.

The normal position of the gravid uterus is thus defined: The normal position of the gravid uterus, in abdomine, during the later months of pregnancy, before labor begins, is the lateral oblique position corresponding, more or less, with the oblique position of the child; the fundus uteri, maintaining the pelvic extremity of the fœtus, being usually directed towards the right side (exceptionally to the left) of the lumbar vertebræ. This definition of course, applies to the position of the uterus as shown by ab dominal palpation, the apparent position being partly due to the shape of the uterus as it conforms to the shape of its contents; vaginal examination will show that the os and cervix have little or no deviation from the median line, while the fundus is towards

Having stated that the renal troubles, etc., are ing article by Dr. A. F. A. King, of Washington, produced in consequence of the child and womb not entitled "A New Explanation of the Renal Troubles, retaining (or maintaining) their normal lateral ob-Eclampsia, and other Pathological Phenomena of liquity above the pelvic brim, Dr. King now draws a Pregnancy and Labor." The purpose of the paper contrast between the abdominal and pelvic cavities. is to present a new explanation (as the author thinks) The womb and child having risen, after the fifth of the etiological relation between pregnancy and month, from the pelvic to the abdominal cavity, "in the nephritic derangements that so often attend it; the latter they should remain until the advent of though the paper does not deal with renal difficulties labor. SOCIETY PROCEEDINGS.

CHICAGO MEDICAL SOCIETY.

Stated Meeting, March 21, 1887. THE PRESIDENT, EDMUND J. DOERING, M.D., IN THE CHAIR.

Dr. James I. Tucker reported a case of HERPES OMO-BRACHIALIS.

This class of skin diseases belongs to the neuroafflicted with some form of nervous disorder. When he came under the author's care five years ago he was emaciated, antemic and suffering from profuse diarrhœa. He had pursued the vocation of proof The Society contributed \$250 for the Treasury of reader until six months previous, when he broke down. His habits were and had been for some time past good in every respect. His principal trouble was a cough of deep, sepulchral sound, which gave him no rest night or day. No mucous or other foreign matter was expectorated. On the 3rd of December there was a neuralgic pain in the right Addresses in the General Sessions of the In- shoulder; on the next day an eruption appeared there TERNATIONAL MEDICAL CONGRESS.—Many of the attended with an almost insufferable sense of heat.

The vascular eruption was fully developed by the have seen. In one case there was not sufficient of the arm, following the branch of the brachial or that of the patient. tions and oleate of cocaine and ointment of glycer-glandular swellings and characteristic eruptions. No inc. It was of no use to employ opiates, for although evidence of a lesion could be found on the genital no effect upon him. He took 240 grains of chloral getic mercurial treatment. hydrate of his own accord at a single dose without any other effect than to make him slightly delirious, also a workman in a rolling mill received a "flash,"

thought cases of herpes zoster were comparatively swollen, red and tender, with a hard, dry, thin and rare here; in the last two years he had met with only red incrustation as one sees on a superficial abrasion one, affecting the fourth and fifth intercostal spaces of the skin. The patient stated that he had rubbed of the right side. Although physiological and ana the lids several times during the week with the back tomical examinations have not yet proven the exist- of his hand, which was more or less covered with ence of true trophic fibres in the nerves, there can grime and sand. He did this to relieve the irritation be no doubt that zoster must be considered as a of the eye. There was nothing in the appearance of trophoneurotic disease. The case was especially the lids or of the eye to excite my suspicion of any interesting from the possibility of syphilis being the complication. For ten days I treated the eye with

minates in that way.

author had not found that these cases almost always to delay definite opinion for a few days. Stated Meeting, Friday, February 18, 1887.

PHILIP ADOLPHUS, M.D., IN THE CHAIR.

DR. HENRY T. BYFORD made the following re-

THE SLIPPERY ELM TENT.

For quite a number of years, I have been using

Within the last few weeks, I have received from that the form in which they are now presented by to render it useful as a substitute for tupelo, sea tangle and compressed sponge in many cases.

dilators of this class. Another advantage is the for many months. This makes a great difference to rapidity of its action. The tents expand sufficiently the patient, who otherwise is obliged to have the insize, or two or three of the same size. This may be flexible soft rubber stem, which may be introduced with a minimum amount of injury to the parts.

and left for twelve or twenty four hours and thus the end of some weeks or months the desired change serve, providing it be used once or twice a week, as is produced. I think the use of a substance that is a mild substitute for the intra-uterine stem in cases not absorbent and does not dilate superior in these of sterility. The patient can go home and keep cases. quiet until she removes it by the attached string, upon the advent of severe pain, or at the end of the sterility of several years' standing, dating from martwenty-four hours. A glycerine tampon placed riage, cured by three or four or more small tents used under the cervix is necessary in such cases to retain once or twice a week. Their power is milder than it in place.

limits its action.

As dilators and applicators in vaginitis, vaginismus, nrethritis, nrethral stricture, etc., they are also useful, and may be ordered of any size, shape or curve desirable.

They should be kept in a tightly covered box or bottle, as they become brittle and lose their rapid expansive power when they get too dry. It would be a good thing to dip them in gelatine or cocoa butter when they are to be preserved for a long time.

Dr. A. Reeves Jackson: I have used slippery elm tents a great many years, and I have no doubt

Messrs. Charles Truax and Co., of this city, some Dr. Byford will render them more suitable for dilatimproved tents made out of the compressed bark, ing purposes than heretofore. In this form, however, By compression, its dilating power is increased so as I have made use of them recently, and have been disappointed as regards their dilating power. Slippery elm forms a slimy mass at the expense of its substance, and while this mucilaginous mass and the mucous discharge which appears with it causes the tent to seem large, the latter does not exert much dilating power, and I was surprised to find that after moistening one of these compressed tents for several hours in water, it was very little larger than before. I have had a great deal of satisfaction in using flat pieces whittled out of the slippery elm bark, in the following manner: I use a small sponge tent, and in order to get the expansive power of that material surround it with a cordon of these slips, so as to protect the mucous membrane from injury. 1 think that in the combination of sponge tent and slippery elm we have the best means for tent dilatation. In this way we get the dilating power of the sponge with the protective effect of the slippery clm.

In cases which stenosis seem to be the cause of sterility, I use non-expansive stem pessaries. My experience in the use of the intra-uterine stem has been very large, and I find, in order to effect any change of structure, that it is usually necessary to The characteristic of slippery elm back is that carry out the treatment for many months. I have upon being moistened a slippery substance exudes, never succeeded in changing materially and permawhich acts both as a lubricant to the tent, and as a nently the direction of the cervical canal in less than protection to the mucous membrane against that in- six or eight weeks, and sometimes over a year has jury or abrasion which sometimes follows the use of been required. The stem may remain undisturbed within an hour or two for the introduction of a larger strument changed frequently. I use chiefly a very repeated until the desired dilatation is obtained, and and worn for months without irritation. It may be since the expanded tents are both soft and slimy, of different degrees of flexibility, a very small one at th a minimum amount of injury to the parts.

A small elm tent may be introduced at the office and by another, larger and stiffer, and so on until at

Dr. H. T. Byford: I have had many cases of that of compressed sponge, and less radical than These tents are also available as applicators, for that of the intra-uterine pessary. These negative the exuding lime carries the drug out from them in-qualities are the accompaniments of nearly all safe stead of into them, gradually dilutes it, and thus remedies. If Dr. Jackson had watched the compressed elm tent, which seemed to expand so little in several hours, he would have found that it expanded two or three times its own diameter in less than two hours, and then became smaller again by having its softer portion dissolved out. In the uterus its substance is not washed away as rapidly as in a basin.

Dr. W. W. Jaccard exhibited a

PLACENTA WITH MARGINAL INSERTION OF AN ABSO-LUTELY SHORT UMBILICAL CORD, MEASURING

NINE INCHES IN LENGTH.

The specimen, placed at his disposal by Dr.

Charles Caldwell, was of interest in connection with enough to require an anæsthetic. mother.

Dr. Jaggard also made some remarks on

THE ANTISEPTIC OBSTETRICAL PADS OF DR. H. J. GARRIGUES AND DR. WM. L. RICHARDSON.

Dr. H. J. Garrigues describes the application of the pad in the following words: The well closed vulva is covered with a pad of absorbent cotton, wrung out in the solution (1,2000). Outside of that comes a piece of oiled silk or preferably thick guttapercha tissue dipped in the solution. To keep this antiseptic part of the dressing in place I use a large pad of dry absorbent cotton, and a rectangular piece of canton flannel or square piece of unbleached muslin, half a yard in both directions, and folded diagonally like a cravat. Dr. Wm. L. Richardson substitutes absorbent scrap or waste done up in cheese cloth for the absorbent cotton. Of course, Dr. Richardson does not insist upon the pad as essential. There is nothing peculiar about the pad except that it seems to me to be a very convenient and use of antiseptics all through the delivery, and the "destroying the activity of the nerve tissue." pad is all that is needed for the convalescence.

sion and community, in the prophylaxis of child-bed his treatment more accurately." I am surely very fever, by Garrigues and Richardson, demand recog-much gratified to have the fact duly recorded that he nition. In the New York Maternity Hospital the mortality from sepsis—Oct. 1, 1882, Oct. 1, 1883, 429 patients—was 6.06 per centum. Garrigues has reduced this mortality to—Oct 1, 1885, Oct. 1, 1886, 463 patients-21 per centum.

In the Boston Lying-In Hospital, the mortality from sepsis. Jan. 1, 1882, Dec. 31, 1882, 288 patients-was 5.55 per centum. Richardson has reduced this mortality to—Jan. 1886, 373 cases—.o per centum.

The American woman insists upon wearing some one at all, it must be antiseptic.

(To be continued.)

GALVANIC MEASUREMENT.

Dear Sir:—The enterprising spirit of Dr. Engelmann, as exhibited in his letter to The Journal of ruary 5, is really very refreshing.

First, he says: "In No. 7, February 12, 1887, of hearing Dr. Engelmann's views. p. 195, Dr. Martin tells us that he has used from 25

Ten ampères Dr. John Bartlett's paper, read at the January meet- . . . would scorch the body as would a stroke of lighting. The absolute shortness of the cord in Dr. ning. This is impossible." Dr. Engelmann con-Caldwell's case did not constitute a mechanical tinues on this line: "No man ever has or ever will hindrance to the progress of labor, although there pass 10 ampères through living tissue, as this would was some slight difficulty in ligaturing the organ, scorch the skin and destroy the activity of the nerve after birth of the child, on account of the proximity tissue." I would like to inquire as to the kind of of the navel of the child to the vulvar orifice of the scientific man who dates to make such unqualified statements in regard to the past, and assert such absolute prophesies of limitations in regard to the future of a subject which all unbiased minds admit is but in its infancy! It is with reluctance that I must remind him that for once he occupies the position which the scientific world did when it "was astonished when Apostoli employed 100 milliampères, which he has increased to a possible 250 with one surface electrode." Here, in Chicago, by means of our improved abdominal electrode of very large surface, the principles of which I described in a paper to the Chicago Medical Society December 20, 1886, an abstract of which appeared in The Journal, of January 15, 1887, and the full text of which appears in this week's number of THE JOURNAL, I have frequently used a current of 500 to 1,000 milliampères without an anæsthetic, without severe pain, and with the same surface electrode double, I have used on one tumor, with very great depth of uterus, a current of 10 ampères; and this, too, without an anæsthetic, without "giving excessive pain;" without "burning the insafe form of dressing to use. The main thing is the tegument;" without scorching the skin and without

Secondly-Dr. Engelmann says: "I am glad to The important services, rendered to the profes-see that Dr. Martin is seeking to define and record notes signs of improvement in my later writings, be they ever so slight; because to admit no progress would be to infer retrogression. At the same time, I am willing to have my first paper on electrolysis thoroughly examined, by an impartial critic, for any loose or inaccurate statements.

Thirdly - Dr. Engelmann further modestly remarks: "It is a satisfaction to me to see that he (Dr. Martin) has accepted my criticism of his paper which I made before the Section of Obstetrics and Diseases of Women at the St. Louis meeting of the kind of a napkin to absorb the lochia. If she wear American Medical Association in 1886." "I then urged," he continues, "the importance of the galvanometer and the necessity of exact measurements, strong currents, and short sittings." If Dr. Engelmann remembers—and if he does not a perusal of DOMESTIC CORRESPONDENCE my paper referred to may serve to freshen his memory—he will find that the above advice was entirely superfluous so far as it was applicable to me, with the exception of his reference to stronger intensity. In regard to this latter point I will confess, in order not to seem under too great obligations to Dr. En-April 16, in which he criticises me for statements in gelmann, that I had heard of Apostoli, and had inreply to Dr. Cutter's letter in THE JOURNAL of Feb- vestigated pretty thoroughly his method and recognized its advantages, long before I ever had the honor

Finally, I will state, in order to more definitely milliampères to 10 ampères through a fibroid tumor, define my present position, that I am obtaining very with one surface electrode and without causing pain gratifying results in the treatment of fibroid tumors employment of improved surface electrodes by which scientists of his day. While attending a large country the current is widely diffused, by which the complete practice he therefore made his desultory studies and adaptability of the surface of the electrode to the observations in geology and botany a sort of recreasurface of the body is accomplished, by which the tion. His love of study and high appreciation of minimum resistance is obtained consistent with min-scientific education made hum the more solicitous to imum pain, I have been able, as stated above, to use secure a good education for his son. BOOK REVIEWS.

A TEXT BOOK OF MEDICINE for Students and Practitioners. By Dr. Adolph Strümpell, formerly Professor and Director of the Medical Policlinic at the University of Leipsic. Translated from the second and third editions by HERMAN F. VICKERY, A.B., M.D., and PHILIP COOMBS KNAPP, A.M., M.D., with editorial notes by Frederick C. Shat-TUCK, A.M., M.D., Instructor in the Theory and Practice of Medicine in Harvard Medical School. With 111 Illustrations. Svo., pp. 981. New York: D. Appleton & Co. 1887. Chicago, A. C. Mc-Clurg & Co.

This is one of the most compact and yet full treatises.

that has appeared on this subject during the last four without obstruction to ventilation. Each tenement-

of the Organs of Locomotion; Diseases Affecting the Blood and Tissue Metamorphosis.

The section devoted to nervous diseases is very complete and presents in a collected form the latest in-

formation pertaining to the subject.

In reading the volume through many thoughts are noticed that have not yet found their way into the freely the most advanced views of the bacteriologists, acute articular rheumatism: "Acute articular rheumatism is an infectious disease. This is shown by all clinical and anatomical peculiarities of the disease; and although the specific organic pathogenic poison cannot yet be demonstrated, still this view of understand its symptoms and course."

The book is a valuble addition to medical literature, as it gives us in a compact and yet comprethe most famous German physicians.

MISCELLANEOUS.

THE MURPHY TENEMENT BILL.—The New York OFFICIAL LIST OF CHANGES IN THE STATIONS AND DUTIES OF OFFICERS SERVING IN THE MEDICAL DEPARTMENT, U. S. ARMY, FROM APRIL 9, 1887, TO Legislature has passed what is known as Murphy's Tenement bill. It provides for the detail of fifteen policemen to enforce the sanitary code of New York city, so far as it relates to tenement and lodging houses. The Board of Health is to make a report annually upon its work. The Mayor, one Commissioner of Public Works, First Lieut, Freeman V. Walker, Asst. Surgeon, ordered from one delegate from the Bureau of Inspection of Buildings, and the Street Cleaning Commissioner shall meet annually between Nov. 15 and Dec. 30 to consider the subject of tenement and lodging houses in New York and make such recommendations for the change of the laws as will best protect the interests of the people, which are to be made to the Governor and Legislature before Jan. 15. The bill provides Grinths, S. H. P. A. Surgeon, detached from the U. S. S. that certain conditions must be observed by owners of these are that where more discovered by the second state of the s of tenements. Some of these are that where more than one family reside on a floor the halls must open Marsteller, E. H., P. A. interested in the question of the etiology and the in the dejecta of cholera nostras, and the curved baprevention of cholera as any other by reason at least cillus found by Deneke in decomposed cheese are of its sixty millions of inhabitants (a number almost fairly shown both in the photography and the cameratwice as great as the inhabitants of any European leucida drawings. These appearances in the plate country outside of Russia), concluded that it would and tube cultures, as you see, enable one to easily be advisable to have the grounds of these differences distinguish between the various growths. of opinion investigated by one of their own representatives.

was almost ended there. It was, however, still ex the first report of the English Commission, with Dr. isting in the City of Palermo, and in some parts of E. Klein at its head. I would say at this point that Spain. I went to Palermo because that was the I regard this as the most important point of Koch's largest field of investigation at the time, and I re- investigations. In the discovery of a reliable and mained there until the epidemic ceased. From there an easily applicable distinctive means of diagnosis visited by cholera in 1884 and 1885, for the purpose Koch has conferred upon the human race an inestimaof examining into their hygienic condition, and of ble benefit for, with the proper application of this learning something of the history of the epidemic in means of diagnosis, health authorities and Governthem. I reached Spain when cholera was, no longer ments will now more than ever before have it in existing in that country-that is, acknowledged offici-their power to prevent an invasion of cholera, and ally as existing—except in the south, along the cut short the spread of an epidemic. The value of Straits of Gibraltar. I had ample opportunity to this discovery, as I have said before, I consider make bacteriological investigations concerning the incalculable. relation of the comma bacillus of Koch to Asiatic cholera, as well as the relation of other germs to that for his claim is two-fold—in the first place the dissame disease, as also opportunities to inform myself-covery of a reliable diagnostic sign, in the second concerning the grounds of difference between Koch place, the discovery of the active agent or cause of Asiand his opponents as regards matters of fact. These atic cholera—I think there is still reasonable ground opportunities also were somewhat extended by my for doubt. The fact that, so far as we know at presvisit to India. I had no difficulty whatever in con- ent, there are none of the domestic animals which firming the statements of Koch with regard to the are naturally susceptible to this disease makes it constant existence of the comma bacillus, in certain difficult to settle the question as to the pathogenic stages of Asiatic cholera in the dejecta of patients power of the comma bacillus by means of experisuffering from that disease; and in confirming also mentation upon animals. It is true, that a quasi his statements as to the distinctive characteristics cholera has been and can be readily produced in of the bacilli distinctions, which enable one to separate them readily from all other micro-organisms rats, by the inoculation of these animals with pure known up to the present time.

As you know, the comma bacillus of Koch is a curved organism, and you know also that other curved bacilli have been found in various localities and in various diseases. The statements of Dr. diarrheea and dysentery patients, in lencorrheeal discharges, in ordinary river water, in well water, in on that account it seems to me that the question of sewage water, and what not. I myself, before I had pathogenesis of cholera must for a time remain open. paid much attention to the bacteriological study of In the course of my remarks I shall have occasion the question of cholera, had met with them in the to say something about the results of the human inseen them in diarrhea, in leucorrheal discharges, Spain, with cultures of the comma bacillus.

assumption very widely entertained by high officers and also in river water. I found even a curved baof the British Government, and particularly those in cillus once in some broken-down beef broth which

The pecutiar characteristics of the gelatine tube some of the other curved bacilli, such as the Finkler The United States Government, being as much and Prior bacilli, which were found by these authors

I can only say that I agree entirely with Koch as to the diagnostic value of the comma bacillus, and I went to Europe in the fall of 1885, when cholera therefore disagree with the conclusions published in I went to Spain by way of the Italian and French of Asiatic cholera at the very first moment of in-Riviera, stopping at different places which had been vasion of a locality or a country, I consider that

But, as to the other part of the claim of Koch— Guinea-pigs, and according to some also in dogs and cultures of the comma bacillus of Koch; but there is lacking the complete chain of symptoms with which we are familiar in genuine Asiatic cholera in man. The vomiting is usually absent, and also the diarrhea; nevertheless, a cyanosis, or algidity, and Lewis, of England, were among the first announced sometimes the cramps, and the death of the animal against even the assumption of Koch for the diag with the well known characteristic intestinal connostic value of his comma bacillus. He found a tents are met with after the inoculations. I myself curved bacillus very much resembling, under the have performed numbers of these inoculations and microscope, the comma bacillus of Koch in the satisfied myself as to that point. But still there is a normal secretions of the human mouth. Curved question—at least in the minds of a great many—as to bacilli were also found in the intestinal contents of whether the symptoms following inoculations of these germs are really those of Asiatic cholera or not, and exudation of the lungs of pneumonia patients, had oculations which were extensively performed in

constantly, from nausea and vomiting; that the pains, omy, might be considered the proper methods.

of his Excellency the President soon, and I have placenta was not delivered until the fourth day. For several weeks following she was confined to her bed with fever, and for three months afterwards she "had hæmorrhagesfrom the womb," so that she was greatly emaciated and reduced in health and strength. During her illness the nurse discovered an exostosis arising from the right ramus of the pubis, midway between the symphysis and inferior spinous process of the right ilium, nearly globular in form and measuring PERSISTENT VOMITING DURING LABOR RELIEVED one and a half inches vertically. The patient had been aware of the presence of this tumor from early childhood, but as it had not perceptibly increased in size, nor occasioned any discomfort, had supposed it was normal until informed by the nurse to the contrary. The nurse had also volunteered the information that, in consequence of its position, she could

In April, 1886, she consulted me, at my office, with beneficial, the popular belief being that "sick labors livery at term, but declined to express the opinion are easy labors." Obstetricians do not seem to have that she could give birth to a living child, at term, attached any special significance to the occurrence per vias naturales, unless I could have the opportuof such gastric disturbances during the first stage of nity of a careful examination of the pelvic cavity. labor; but when persistent during the second stage, To this both the wife and husband finally consented producing exhaustion and lessening the activity of and, by appointment, this exploration was made two uterine contractions, the safety of the patient may days afterwards, at their residence in this city. This examination disclosed the existence of a sharply The complication of labor with persistent vomit-pointed exostosis jutting obliquely upwards from the ing must be very rare, as I have not found a single inner surface of the ramus of the pubis immediately case reported in detail, after an extensive examina- below the external and larger tumor, measuring (aption of obstetric literature. Her pulse and general condition were good, parted with the agreement that if she should become, except that during these attacks her pulse would rise pregnant I would receive notice as soon as she was rapidly, sometimes to 120, and then subside during entirely satisfied of the fact. To this I reluctantly, the interval to 80 or 90. There was also a frequently consented, for I would have preferred to have termi- recurring, irresistible desire to pass water. Her cournated my services with the expression of my opinion and been superseded by some colleague more anxious than I to witness the possibilities of the future.

Her womanly courage proved equal to her heroic enthusiasm. Late in July I received a note from her communicating the information that she was pregnant and requesting me to call. She dated her pregnancy from the 7th of May. I found her in perfect and robust health, full of enthusiasm, and equally determined as when we parted in April. The whole subject was again calmly and deliberately discussed. I left her with the injunction to give me immediate notice rying. The signs of exhaustion were shown in the of any symptom of ill-health, and especially of the first movements of the feetus. On September 8 1 was informed that the first sensation of motion of the fœtus had been felt the day before. My examination of the pelvis verified the condition ascertained in April. I could not discover any other obstacle to labor than the exostosis before described. The date head and condition of the cervix remained unchanged. of confinement was then fixed for February 7, 1887. I left her with the statement that I would not, if then, interfere in any manner before the completion of the seventh month, unless something unexpected should the beginning of the vomiting and subsidence of the occur. At this visit, as at every visit made by ap- uterine contractions, and their correspondence with pointment during her pregnancy, she had a severe the moment when the pain or contraction had reached rigor with marked trembling. Similar attacks were its maximum intensity. If this observation were cornot infrequent, and were attributed by the patient to rect, and the method adopted correctly measured the "nervousness." Three methods of relief were considered: not be conducted until they had subsided.

convinced the feetus was small, probably a female with began the administration of the A. C. E. mixture.

Either of these operations might secure the birth of a small head. Her health had continued, without

January 2, 1887, Dr. J. Taber Johnson made a careful examination. We concurred in the decision

Labor began at 5 P M. on February 8, and termiwould be less, but not necessarily fatal to the child. plications. The patient and nurse agreed in the She accepted these possibilities with the greatest statement that the gastric disturbances had continued age was unabated, and her cheerfulness and enthusiasm were unimpaired. The bowels and bladder had been freely evacuated before my arrival. The shiverings were arrested by the usual potation of whiskey, which the nurse had refused to allow without my consent. The vomiting not only continued, but manifestly increased in duration and violence, notwithstanding my efforts to arrest it with pellets of ice, alkalies, and hot water. The matter vomited was fluid, very slightly streaked with mucus. The intervals of relief grew shorter and the pains more acutely teasing and wormore continuous frequency and feebleness of the pulse, varying from 110 to 124, increasing restlessness and anxiety, with a facial expression of suffering and tire, and constant appeals for assistance. From the time of my arrival until midnight there was no appreciable progress in the labor. The relations of the

With the end of my index finger against the most dependent portion of the bag of waters during a pain, I frequently recognized the simultaneousness of rupture of the amniotic sac, a rectal injection of After a careful examination in December, during chloral hydrate, and anæsthesia. I determined to try the early days of the eighth month, I concluded to the last first and, in the event of failure, each of the defer the induction of premature labor, because I was others in retrograde succession. At 11:50 P.M. I

the head had escaped. The vomiting did not return.

At 1:30 A.M. I ruptured the amniotic sac, and delivery was completed at 3:30 A.M., February 9. The sac was ruptured because its persistence retarded the labor. After the cessation of the stomachal complication nothing worthy of special notice occurred. During the progress of the descent of the head I examined the relation of the head to the exostosis several times. It did not present any obstacle to delivery. There was not upon any part of the child any mark of its impingement. The child, a female, weighed 712 pounds. Her convalescence was satisfactory, except unusual thirst and hunger during the first day, and delay of milk until the sixth.

The patient was a healthy, robust young woman, bright, intelligent and cheerful, and possessing more than ordinary will-power, self-control and conrage. was, from the beginning to the termination of pregnancy, under continuous and very severe mental strain. At times, when disturbed by some perturbating circumstance, such as a visit by appointment from me, the dominating influence of her will would lose its controlling power, hence the rigors and shiverings. These, as well as the persistent vomiting, must be regarded as nervous, perhaps hysterical phenomena. The condition of her health during the period of pregnancy excluded uraemia and every disorder of the chylo poietic viscera which could have borne any etiological relation to the hyper-emesis. Mental strain with loss of will-power culminated with the onset of labor. The knowledge of the fact that with the beginning of the pains the travail had commenced, to which for nine consecutive months her highest and noblest aspirations, as well as the gravest forebodings, had pointed as the most momentous act in her life, was quite sufficient, even in one so courageous and self-poised, to produce some serious neurotic complication.

The causal relation of the mental condition to the persistent vomiting is affirmed by the fact that obliteration of consciousness, pain and cerebration by narcosis, arrested the stomachal disorder, which recurred upon the restoration of these faculties, but again ceased, not to return during anaesthesia, notwithstanding the contractions of the womb continuously increased in intensity and duration during the same time. The coincidence between the uterine contractions and the vomitings does, however, seem to establish the relation of cause and effect. Sick labors are usually associated with rapid dilatation of the cervix. In this case the os had dilated to two fingers' width (about the size of a silver haif dollar) at the expiration of the seventh hour of continuous labor, and dilated much more rapidly after the arrest of the vomiting.

Vesical tenesmus is constantly found in connection

The vomiting ceased; the pulse improved in force a dilatable os, and ceased with the vomiting during and volume, and slowed, and the pains became more narcosis. The slowed dilatation was undoubtedly direct and distinctly intermitting. After continuing due to the arrest of uterme contraction by the simulthe anaesthesia for three-quarters of an hour it was taneous attacks of nausea and vomiting. With a suspended. The vomiting recurred. The anæs- dilatable os there was no protrusion of the amniotic thetic was resumed and not again withdrawn until sac, and the amount of liquor amnii was small, so that intra uterine pressure could not be considered a factor unless, perhaps, the small quantity of amniotic fluid permitted closer contact of the uterus with the irregularities of the feetal ovoid. During the first pregnancy the patient had suffered continuously from nausea and vomiting, but during the second she had been entirely free from any digestive disorder. Thus, while I would not deny the reflex relation between the contractions of the uterus and the stomachal complication, the history of the case, and rather singular array of phenomena occurring during labor, together with the relief obtained by semi narcosis, compel me to reject it as the sole or chief element of causation of the persistent vomiting.

This case is another striking illustration of the value of anæsthesia in labor. The contractions of the uterus were concentrated and increased in power. Nevertheless, as admitted since her confinement, she Usually I do not commence the administration of the anæsthetic before the beginning of the second stage, but I have quite frequently witnessed a similar result when, in consequence of some perturbation, the nterine contractions seem to be ill defined, diffused, and as it were wasted. In very many cases at æthesia expedites labor, in a few it retards it, and in very rare instances it is not well borne, and has to be withdrawn. During the past two years I have most frequently employed the A. C. E. mixture with satisfactory results. It seems to be equally effective in lessening suffering, with less narcosis.

AN UNUSUAL CASE OF LACHRYMAL STRICTURE.

BY H. D. THOMASON, M.D.,

OF ALBION, MICH.

S. C., male, aged 15 years, presented himself at my office two months ago, suffering from, and presenting all the characteristic symptoms of, stricture of the lachrymal duct. There was also a fistulous opening situated below the junction of the canal and duct, making an ugly sore, and discharging tears and pus. This stricture was of several years' standing, and had been annoying, but the fistula was recent, and it was for this that his parents brought him for treatment.

His history was not encouraging—there were strong reasons to suspect hereditary specific taint. He presented an anæmic appearance, had been afflicted with partial hemiplegia since babybood, at d for years had been the victim of severe chronic pharyngeal and nasal inflammation, accompanied with ulceration of the turbinated bones.

I placed him on anti-specific and tonic treatment, and by means of douches and sprays, nasal, postnasal and pharyngeal, endeavored to modify the difficulty. By means of Anel's syringe efforts were made to pass a stream through the fistulous opening and with a rigid os, but in this case it was persistent with the lower punctum into and through the duct, but unsuccessfully. The fistula, however, healed, but an has neither smut nor smell. While of its efficiency absolute stricture remained. With a set of Bow- I can only say after sixteen years use that I am satman's probes, I decided to dilate the stricture. The isfied: I ask nothing better. I first called attention to patient was of such a nervous temperament that this neat, choice dressing in an article entitled "Fifty nothing could be accomplished unless under an an- Fractures in Mining Surgery," which appeared in the aesthetic, which was always employed when the probes Medical and Surgical Reporter for September, 1878. were used. The lachrymal canal was thoroughly laid. The method of application is simply to keep the open to its junction with the duct, and a No. 1 probe wound covered with the powder. Wounds thus inserted. This was arrested at a point a little below treated heal on the average in about one-third of the the junction, but by gentle perseverance this point time required for similar ones treated by liquid, oily of resistance was passed. Other slight obstructions or salve dressings. In converting compound fractures were overcome, until, when estimated to be within into simple fractures by this method, the flesh wound one-twelfth of an inch of the final termination, an is often healed in one-twelfth of the time required to obstinate obstruction was encountered, which con-theal it by wet dressings or salves that are frequently veyed the impression it was an obstruction of bone, removed and re applied. Illustrations are unnecesand which successfully resisted the further passage of sary if I have clearly defined the classes of wounds the instrument. A No. 2 probe was easily passed to in which this dressing is applicable. Although hunthis point and then arrested. A few days later, again dreds of cases thus treated could be adduced that placing the patient under an anaesthetic, beginning would prove interesting reading, I will describe the with a No. 2 probe, Nos. 3 and 4 were successively last case only in which this dressing was employed: passed to and arrested at this same point.

No. 8, and being unable to get beyond this obstruction my office. There was a semi-circular scalp wound tion, an instrument was ordered and made by Chas. six inches in length over left parietal bone, and a Truax & Co., of Chicago, of the form and diameter fragment of this bone almost the size of a silver of a No. 8 Bowman probe, but armed with a steel quarter dollar, stuck up trap-door fashion. The flaps drill at the distal extremity. A regular No. 8 probe had shrunk wide apart and were swollen and angry, was passed to the obstruction and withdrawn, in as the injury had occurred twenty hours previously. order to open as well as could be the tract, and the The whole wound looked bad, being full of hair, dirt, armed probe entered. There was a little difficulty serous effusion, chips, leaves and brush-wood. The experienced in passing it, owing to the disposition of patient was very feeble, but conscious. A dose of the sharpened edges of the drill to catch in the mem- whisky and hot water was administered and the brane, but patience and perseverance overcame this, wound douched for one hour with warm carbolized and the obstruction reached, several rotary motions water. When the bony fragment had been gently of the drill were made, and there was no difficulty in depressed almost to normal position, (I could not detecting when the bone was perforated. The drill succeed in reducing it to the normal level) the scalpwas withdrawn, a No. 8 probe passed the entire wound was sutured with horse hair. Tannic acid length without difficulty. The patient experiences was then applied, and directions given that it be great relief, and is in a large measure free from dusted on freely every few hours, more especially if the troublesome symptoms attending a lachrymal moisture should appear over any part of the wound.

Albion, Mich., April 16, 1847.

BY T. J. HUTTON, M.D.,

OF FERGUS FALLS, MINNESOTA.

Tannic acid forms an excellent dressing in three classes of wounds, viz.:

1. Incised wounds-applied after the sutures are inserted, or adhesive plaster is on—if the wound does not require stitching.

2. Small wounds of irregular form and recent occurrence.

3. Wounds of moderate size in compound factures. Wherever applicable it excels all other dressings in the following respects:

- r. Convenience.
- 2. Cheapness.
- 3. Cleanliness.
- 4. Efficiency.

It is always ready. It costs but a trifle. It requires no greasy mixing, measuring or muddling and

F. J., aged 16, German, on January 26, 1887, was Then, after passing all the set of probes, including struck by a falling tree. Next day he was brought A laxative was administered, also small doses of aconite and bromide of potassium.

The flesh wound healed by first intention. No fever ensued; the pulse never exceeded 92. The A NOTE ON TANNIC ACID AS A SURGICAL DRESSING. Patient went home on the 31st-the fourth day of treatment, and two weeks later his father reported that he was "all right."

April 9, 1887.

MEDICAL PROGRESS.

Influence of Altitude on Phthisis.—Sur-GEON MAJOR NATHANIEL ALCOCK says: The explanations hitherto offered of the action of altitude upon phthisis amount to three: greater expansion of the chest from aerial rarefaction; absence of bacterial organisms from the air and general tonic effect.1 Were the first of these effective, some improvement would be expected to follow the use of gymnastics at lower levels; of the second it may be said that every consumptive carries his own microbes with

The Lancet, Jan 8, 1887.

to which it is due.

of splenic fever, has shown that "splenic fever can or 107° are communicated to their constituent never be taken by fowls; in vain are they inoculated molecules, disorganization follows. Hence, it is inwith a considerable quantity of splenic blood." "Now, the temperature of birds being between 106° and 108°, may it not be," said Pasteur, "that the tion of 6000 ft., such alteration of molecular motion fowls are protected from the disease because their will take place in the blood as to be incompatible blood is too warm? A hen was taken, and, after inoculating it with splenic fever blood, it was cooled of the tubercular microbe; in fact, the patient will down to 100°. At the end of twenty-four hours the hen was dead. Again, a hen was inoculated, subjected like the first to cooling, and when the fever is the vista with regard to the epidemic levels of was at its height it was wrapped in cotton-wool and yellow fever, malaria, cholera, etc., which it must placed in an oven at 95°. In a few hours it was open up, and strange the possibilities which might fully restored to health. Hens killed after having result from the artificial production of the required been thus saved no longer showed the slightest trace; of splenic organisms." Thus it is proved that the microbe of one of the most virulent diseases reaches its condition of highest life and greatest reproduction in blood at a temperature of about 100°, but that in the same blood at 107° it ceases to exist. Presumably, then, if the subjects of some forms of bacterial infection could survive a proportionate elevation of temperature, they too would overcome the poison.

The question here arises, Are there any conditions in which the blood of a living man can be made to assume the molecular action equivalent to a temperature of 105° while the animal heat remains at 98°? Clearly such is quite possible by diminishing atmospheric pressure while the temperature remains fixed. We know that it would be quite impossible to boil water at the sea level with 199° of heat, but if the water be removed to St. Gothard, 6808 ft. high, boiling will at once take place. Professor Thomson, in his opening address at the British Association, said: "It is scarcely possible to help anticipating in idea the arrival at a complete theory of matter, in which all its properties will be seen to be merely attributes of motion." It is already accepted that the only difference between the liquid and gaseous states is that of a molecular motion. Consequently, if 199° of heat can make water boil at St. Gothard, it is apparent that this temperature can there produce an amount of molecular motion which not less than 212 could excite at the sea level. Further, as 199° is to 212 so is 98.4 to 104.8°; therefore the rate of molecular motion to which a temperature of 98.4° would give rise at St. Gothard could only be attained at the sea level as the result of a temperature of 10.4.8°.

Professor Clifford has shown that "the energy of the single particles is always proportional to the temperature of the gas," provided the pressure re

him; and the third is too vague to need discussion. atoms, if a man whose temperature at the sea level It may therefore be assumed that no satisfactory is 98.4° be removed to St. Gothard, it is evident explanation has as yet been suggested. The specific that both the gaseous and liquid molecules in his organism of tubercle has an established identity; blood must attain a rate of motion corresponding to consequently the disease must be ranked among the what would have been produced at sea level by a special infections and its aggravation or arrest must temperature of 104.8°. But the experiment of depend upon the fertility or sterility of the microbe. Pasteur has demonstrated that the optimum temperature of certain infecting organisms is about 100°, Pasteur, in his splendid researches on the poison and that when the vibration rates equivalent to 106° telligible that, if a consumptive patient whose temperature at sea level is 98.4° be raised to an elevawith the healthy existence and effective reproduction be placed in the position of the bird to the splenic fever poison. If this reasoning be sound, wide result from the artificial production of the required conditions.—Lancet, March 19, 1887.

> TREATMENT OF BOILS BY INJECTIONS OF CARBOLIC ACID.—Dr. BIDDER, of Paris, has described a method of treating furuncles by parenchymatous injections af carbolic acid. If the boil is a small one, he gives one injection of a few drops of a solution of carbolic acid (2 per cent.); if it is of median size, two injections are given, the half or the whole of a Pravazsyringeful of the solution being used on each occasion. In the case of large furuncles, for example, half the size of a man's hand, Dr. Bidder injects at four different spots the contents of four Pravaz syringes half or wholly filled with a solution of 2 per cent. of carbolic acid. These injections are given only once. This treatment is strikingly successful. There is some smarting at the seat of injection at first, but the pain soon disappears, and the next day there is a marked improvement in the patient's condition. The inflammatory swelling subsides very quickly, and in eight or ten days even the largest furnicle is dispersed. By this plan no unsightly scars are left, a circumstance, which in many cases is of considerable importance. The success of the treatment is probably to be accounted for by the fact that either the microbes which cause the disease are killed, or the medium in which they thourish is destroyed-British Medical Journal. [This treatment has been in use in America for almost ten

Hypnone.—Von Schüder writes of fourteen patients treated by hypnone, in whom favorable results followed. A dose of from 2 to 4 drops was sufficient to produce sleep of several hours' duration; the effect was especially happy among the phthisical. No ill effects were observed. In one case only, after 6 drops had been given, the patient awoke from a long sleep with headache and slight vomiting. The effect dependent upon the dose and individual peculiarities mains unaltered. Consequently, since the condition was manifested after from one half to one and oneof every organism is but the aggregate of its ultimate half hours.—Der Pharmaceut, Feb. 1, 1887.

SATURDAY, APRIL 30, 1887.

THE IRRADIATION OF MOTOR IMPULSES.

If a man perform work with the muscles of, for example, his right hand exclusively, and to the point of fatigue, can he thereafter perform as much work of the same nature, with the left hand as he could if the right hand had not been previously exercised? Such is the question discussed by Dr. N. A. RAN-DOLPH before the College of Physicians of Philadelphia on March 2. The question does not relate to a comparison of the work of the two hands, but to an examination of the work which may be done by one hand as conditioned by the previous exercise or non-exercise of its fellow; and it is clear that the answer to question depends solely on intracranial when its work was initial." As a rule, more work processes, and that the answer would throw light on was accomplished by the simultaneous exercise of the the functional independence or interdependence of two forefingers than by their successive exercise. the two halves of the brain. And to answer the In such simultaneous exercise of both hands, apquestion two conditions are prerequisite: the subject parently from some unconscious effort at rhythm, it of experiment must be ignorant of the object of the was seen that the movements of the left forefinger investigation, as otherwise he will be unconsciously were generally more active and rapid than when a partisan of one hand, and there must also be a used alone. This is in accordance with experience strong inducement for him to exercise his volition to the utmost.

some of the more vigorous and intelligent convicts will be remembered that they have shown that the in the Eastern Penitentiary, the stimulus being a knee-jerk is reinforced by any voluntary movement money prize to the one who performed the most work in any part of the body, and that this reinforcement in a given time. In the first series of experiments is apparently due to such an irradiation of motor imrubber-bulb syringes, identical in all their measure- pulses from the active centres to other similar cenments, were used, the work performed being esti- tres, as placed them and their related muscles in a mated by the amount of water which the men could condition of heightened responsiveness to external was that either hand could do more work when its duce a sympathetic fatigue in other centres. These

exercise preceded than when it followed the similar exercise of its fellow. "It was found, however, that the muscular effort could not be entirely restricted to one side of the body in this method, as great fatigue was always accompanied by a grimacing and writhing which implicated the muscles of both sides of the face and trunk." In the next experiments a Morse telegraph instrument was used, the muscular movements being restricted to an up and down motion of one finger of each hand, the number of such movements in a given time being recorded on the telegraph slip as dots or dashes, in accordance with the rapidity of contraction and relaxation of the flexors of the fingers. The results of these experiments were uniformly confirmatory of those in the first experiment; but the method caused such eye-strain in counting that it was abandoned. A clock-work instrument was then made, so that the records could be made on a dial and easily noted. Six subjects were used, and to each was given fifteen minutes in which to make his record with, for example the right fore finger, after which the left fore-finger was similarly exercised. The same process was repeated on the following day, but beginning with the finger of the hand used second on the previous day.

These results were also practically uniform. "The man who for fifteen minutes tlexed and relaxed his right forefinger with the greatest speed possible to him would, on the following day, accomplish on an average, nearly 10 per cent. less work with that finger when its exercise was consecutive to a similar exercise of the forefinger of the opposite side, than of many pianists. It will be seen that these facts are closely related to the observations of Weir Mitchell Suitable subjects were found in the persons of and Morris Lewis in regard to the knee-jerk. It transfer from one vessel to another in a given stimuli. Dr. Randolph's experiments seem to contime. The uniform result of some forty observations firm this, and show that fatigue of one centre may in-

observations further suggest that the centres for volition, attention and coordination are not, as regards their functional activity, bilaterally symmetrical and independent; that is to say, "these functions have not attained complete differentiation into right and left will, attention, or coordination; that, probably, the first effect of the voluntary activity of a portion of one cortical motor area is a stimulation of the corresponding portion of the other hemisphere—a stimulation that may result in its slightly premature fatigue; that apparently more work can be effected through the voluntary simultaneous exercise of two such portions of the motor apparatus than by their independent exercise one after the other."

Can we explain Dr. Randolph's facts by saying that the overflow of energy on to symmetrically related centres, or on to others, is competent to weaken them without being strong enough to cause motion? Dr. Weir Mitchell inclines toward the use of the overflow theory to explain the lowered capacity for work by one hand after exhaustion of the other. It will explain why in consentaneous use of ciple of counter-irritation, that there is a certain two symmetrical parts more work is done than when they follow one the other. The overflow would be by means of counter-irritation the nerve force is in this case valuable, and not damaging or wasteful. drawn to a distant point, it is removed from the in-He referred to the fact, which he and Dr. Lewis have flamed part, we may agree with Dr. H. C. Wood established, that "When we use the maximum power that, while modern science does not recognize the of one hand on a dynamometer, the coinstantaneous truth of this theory, it looks as though there is a ceruse of the other hand adds nothing to the result; tain amount of truth in it. "Every one who has and this form of experiment has been commonly worked in a gymnasium will recall the fact that he used as a test of the reinforcing capacity of the op- cannot use the two hands simultaneously with the posite member. If, however, using two fingers, or same force as he can when the two hands are used the grip of the thigh adductors, on the bulb of a separately. This shows some relation between the mercural dynamometer until great exhaustion oc- nerve centres which we have not as yet got at." It curs, and we then make a new effort at the moment would seem that when we use our muscles vigorously, of violent use of another member, the mercury leaps two kinds of fatigue are produced; a local fatigue quite to the level attained during the first effort by and a general fatigue. If a man uses the right arm unfatigued muscles. It does not seem easy to ex- vigorously, he not only fatigues the right arm, but plain this fact, except by assuming that the over- also the whole body. Dr. Wood believes that if flow of energy usually wasted is in this case made these investigations are continued, it will be found efficient."

lar and ganglionic tone. When we strike the patel- ous use of the other arm. As suggested by Dr. lar tendon, a sudden, distant, voluntary act adds Mitchell, "the relation between muscular exertion and reinforcement. What happens to the muscle or gan-mental exercise should be studied. glion so influenced? Is it made more sensitive to by personal experience that when mentally fatigued impressions, or is there with this a slight flow upon it he is incapable of performing the usual amount of of motor energy? And if so, can we measure the physical labor. This is probably independent of any effect, and thus influence what we conceive of as question of overflow, and goes back to the higher muscular tone? Dr. Mitchell has been engaged in cerebral centres and their relation." As suggested discovering if these reinforcements do cause motion by Dr. Mills, it is a well-known clinical fact that -i.e., a slight preparatory muscular contraction an old hemiplegic, if examined carefully, will be making the subsequent volition, or other excitatory found to have not only the decided loss of power and

activity, more potent in its results. He has been able, so far, to prove that in some spastic cases distant muscular effort, such as a grimace, really causes distinct and measurable movement in the extensors of the thigh and presumably elsewhere. But it is not yet clear whether in normal man remote motion is thus capable of causing slight shortening of all other muscles. We often speak, says Dr. Mitchell, of nerve power as if there were a common stock from which are drawn the supplies needed by every active organ, and reason that it is unwise to try to carry on at once two functions which exact large expenditures—as digestion and intense thought, or digestion and exercise. Practically the difficulty may be one chiefly of blood supply. This is illustrated in the not rare fact that some feeble people cannot digest except when at rest. These facts suggest the idea that perhaps Dr. Randolph's cases would lose 10 per cent. of mechanical capacity after a period of exhausting mental labor or during digestion.

In regard to the old theory for explaining the prinamount of nerve force in the system, and that when that after prolonged use of the leg, there will be loss This experiment brings up the question of muscu- of power in the arm, perhaps as great as after previaccompanying conditions resulting from the lesion is given for each year from 1868 to 1886 inclusive, on the opposite side of the brain, but also a certain and varies from 47.7 cents to 72.6 cent. The perdiminution of strength in the limbs of the other side; centage of deaths to the whole number of patients a condition which is not entirely due to the general was 612, that of typhoid fever alone nearly 17, and loss of physical power present. The phenomena that of pneumonia 45 per cent.; while in another exhibited in certain cases of unilateral spasm seem hospital the ratio of deaths from typhoid fever is also to be related to this subject.

ANNUAL REPORTS OF PUBLIC HOSPITALS.

The twenty-sixth annual report of the Cincinnati Hospital, which has just been laid on our table, reminds us of the many and great advantages that would result, if all public hospitals for the sick and injured were required to make full annual reports, for which the one before us would afford an excellent pattern. It is a neatly printed pamphlet of only 78 pages, yet contains a concise description of the hospital buildings; full list of the officers, medical staff, resident physicians and nurses; complete financial statement of all receipts and expenditures, including every item of quantity and cost; the number of admissions and discharges, medical, surgical, obstetrical and gynæcological, with the particular disease or accident affecting each patient, and the results of the treatment; and also the total number treated during the year, the average time in the hospital, the total cost and the average cost per day per patient. If every public hospital containing fifty or more beds would publish annually a complete official report on the model given us in the twenty-sixth annual report of the Cincinnati Hospital, we would soon have the materials and data for solving many important problems, both economical and medical much more satisfactorily than at present. Enough can be gleaned from the few, and often important, reports of hospitals now furnished to the public, to show great differences in the expenses per patient in different hospitals, even when located in the same city, and apparently receiving the same class of patients; and almost as much disparity in the results of treatment, both in the general aggregate and in relation to particular diseases. Thus in one hospital the total cost per day for each patient is given at about \$1.20 and in another at only \$0.67 $\frac{7}{10}$. In the report of the Cincinnati Hospital the net cost per patient per day

only 5 per cent, and from pneumonia less than 15. Experiments such as those of Dr. Randolph are A series of official reports from the public hospit-

AMERICAN PUBLIC HEALTH ASSOCIATION.

The preliminary circular announces that the next annual meeting of this important organization will be held in Memphis, Tenn., November 8, 9, 10, 11, 1887. The Executive Committee have selected the following topics for special consideration at the meeting: a. The Pollution of Water Supplies; b. The disposal of Refuse Matter of Cities; c. The disposal of Refuse Matter of Villages, Summer Resorts and Isolated Tenements; d. Animal Diseases Dangerous to Man. No more interesting or important topics could be selected for the thorough study of the Sanitarians of this country at the present time. All papers intended for this meeting should be plainly written or printed, and be in the hands of the Secretary at least twenty days before the date of the annual meeting. Notwithstanding the enumeration of the topics mentioned, it is understood that papers of merit on other subjects will not be excluded. George M. Sternberg, U. S. A., Baltimore, is President, and Irving A. Watson, Concord. N. H., Secretary.

AMERICAN SURGICAL ASSOCIATION. — The next annual meeting of this organization is to be held in Washington, D. C., commencing May 11, 1887, and is expected to continue three days. The preliminary programme contains a list of many papers, furnishing interesting topics for discussion. Hunter McGuire, M.D., Richmond, Va, is President, and J. R. Weist, M.D., Richmond, Ind., Secretary.

STATE MEDICAL SOCIETY OF WISCONSIN.—The next annual meeting of this Society is to be held at Oshkosh, commencing on Tuesday, May 3, at 8 o'clock r. m. Reports of such a number of Standing and Special Committees are expected as to make a full amount of interesting and profitable work for the meeting.

SOCIETY PROCEEDINGS.

MEDICAL SOCIETY OF THE DISTRICT OF COLUMBIA.

Stated Meeting, March 2, 1887.

THE PRESIDENT, Jos. TABER JOHNSON, M.D., IN THE CHAIR.

Dr. S. C. Busey read a paper entitled

PERSISTENT VOMITING DURING LABOR RELIEVED BY ANASTHESIA.

(See page 484.)

the tardy labor were due to a too great determination ceased. He had her sit up in bed for awhile and of nerve force to the solar plexus, thereby depriving in two or three hours she was delivered. the hypogastric plexus of the requisite amount of force necessary for the accomplishment of labor, and of tedious labor with satisfaction. We should be that in order to overcome this abnormal state he had cautious in its use and the selection of the anæseither to administer by the stomach some agent ca-thetic. For instance, the primary effect of chloropable of relieving the overcharged nerve center, or form was upon the heart, while ether is known to would have to resort to an anaesthetic, which by its have produced hemorrhage from the air passages and action on the cerebro spinal system, would probably lungs. The "A. C. E." mixture, he thought, was the withdraw nerve force from the solar plexus to the safest and most popular. cord and that then a due determination to the hypogastric plexus would take place. He resolved, in order article of Dr. Fordyce Barker upon the subject, in to accomplish the desired end, to try first a cupful of which he claims that chloroform is perfectly safe. crushed ice given as rapidly as could be swallowed, as he had previously learned that ice so administered roform in labor, and that he used it in perhaps seven-

moted efficient uterine contractions and prompt delivery. In this connection, he felt it incumbent upon him, to again make special reference to the good effect of ice when properly administered in labor attended with inertia, and he was satisfied, that many cases occurred where, if it had been administered, the use of forceps might have been dispensed with. He could recall a case where nterine contractions had ceased almost entirely, although large and repeated doses of ergot had been given, and the application of the forceps seemed inevitable, but before using them, he gave a large teacupful of ice as rapidly as could be swallowed, with the result of restoring efficient pains and a rapid delivery.

In the case under consideration, however, the THE PRESIDENT stated that he had seen the cases—crushed ice failed to accomplish a good result, so he

Stated Meeting, March 16, 1887.

THE PRESIDENT IN THE CHAIR.

Dr. D. S. Lamb presented the specimen and read. the history of

A CASE OF OSTEOMALACIA.

November, 1865 (she was then 47 years old), while 1886. walking home one day, she was suddenly seized with severe pain in dorsum of left foot; this was found to ciated; bedsores on buttocks; right eye had been be swollen and reddened. The pain continued removed. Right lower limb redematous; left, flabby; through the night. The late Dr. W. B. Magruder was linear white scar on inner side of left ankle; eczecalled in the morning. After careful examination he matous scabs above ankle; muscles of limb showed failed to find the cause of the trouble. The pain, fatty atrophy; bones of thigh, leg and foot atrophied, redness and swelling recurred at intervals for two the atrophy increasing from above downwards. The years, sometimes preventing sleep and finally inter- compact substance was thin, porous and very friable; rupting her work. In the autumn of 1867, after an in some places so soft as to be cut with a knife withunusually severe paroxysm, lasting several weeks, out turning its edge; the cancellous substance apshe fell and sprained her left ankle, for which she was peared as plates and fibres loosely held in a mass of treated by the late Dr. S. B. Blanchard. She kept white granular matter, largely composed of fat, in her bed several months and never resumed her regular occupation, but did some sewing at her house. some places of a gelatinous appearance, filling all the medullary canals and spaces. Brain showed increase She was able to get about the house with compara of subarachnoidal fluid; cysts of choroid plexus. Old tive ease and sometimes walked short distances. pleuritic adhesions both sides, especially at apices, About a year later she had a second fall and another under which was fibroid induration; both lungs showed severe sprain of the same ankle, after which she red and gray hepatization in lower lobes. Heart walked with much difficulty and had constant pain, normal; aorta and pulmonary artery congested on In 1872, unable to earn her living, she was admitted pericardial surface; aorta showed fatty degeneration. to the Home of the Women's Christian Association. Liver somewhat atrophied; gall bladder full. Spleen She then walked with a cane, waited on herself and somewhat atrophied. Pancreas normal. Stomach took care of her room. November 15 she was sent normal. Small intestine full of flatus. Large intesto Columbia Hospital. She had then constant pain tine contained much soft faces which excessively in her left leg and ankle, pain along course of post-distended the rectum. Right kidney cirrhotic; surtibial nerve, and some cedema about the ankle. face showed many minute aqueous cysts and about

for it, and he began giving it in the latter part of the Thompson removed a portion of the nerve at the second stage. He puts twenty to thirty drops on a seat of the severest pain. Wound healed by first handkerchief and allows the woman to inhale it here intention, but no relief followed. She returned to self just as a pain is coming on. In this way she the Women's Home. She now went on crutches and gets enough to dull her sensibility to pain, but not with great difficulty; pain more severe. Six weeks enough to keep her unconscious between whiles. In afterwards she had an unusually severe paroxysm of a large number of cases there may be a few instances pain in the foot, which was reddened and swollen; in which anæsthesia has retarded labor enough to she was put to bed and never left it again in fourteen make the forceps necessary, but he does not think years. During this time she had constant and severe that it will produce post partum hemorrhage. On pain, sometimes excruciating; she became emaciated the contrary, the restlessness and exhaustion pro- and anamic; the toes of the left foot became flexed, duced by a long labor without relief is much more finally causing ulceration of the under side of the likely to cause hiemorrhage than the chloroform, foot; foot redematous, redema extending to knee. He prefers chloroform to ether in heart or kidney Diet generous, her fancies gratified, but she never improved in her general condition. She often had Dr. T. C. Smith thought that aniesthesia did "drawing" pain in the foot, and just before a storm extending to the thigh; and spasm of the leg which Dr. Busev has seen hamorrhage follow anaesthesia, gradually diminished as the disease progressed. For but he did not attribute hemorrhage to it, but rather several years she did fine needlework and depended to protracted and exhausting labor. Chloroform on conversation for pastime, being unable to read. was safer than ether, but the "A. C. E." mixture was About 1881, she had irido-choroiditis of left eye, superior to any. Narcosis was not so profound as which recurred sometimes in one eye, sometimes in by the former while it is just as effective in relieving the other, and at times in both. In December, 1885, pain. Although amesthesia is a great boon in mid- an ulcer appeared on the right cornea, and perforwifery, it may sometimes prolong labor instead of ated; eye removed by Dr. S. M. Burnett. During these years the pain steadily increased, the foot rotated outwards, and in 1885-6 the leg rotated outwards at the knee. The cedema increased and the limb became a shapeless mass. For the last six months of life she could not lie down because of the "drawing" pain. Her pains increased much in stormy weather, and this led many physicians to diagnosticate rheumatic arthritis. Her appetite became capricious, constipation obstinate, urine scanty Dr. Mary Parsons reports the following history: and loaded with urates. Through her later years she Charlotte J., white, single, Virginian, seamstress. In was a marvel of patient endurance. Died June 15,

Necropsy by Dr. D. S. Lamb: Body much ema-

a dozen prominent yellowish masses, size of pinheads and larger, which on section turned out granular matter; at lower end of kidney was a sarcoma, size of small walnut, encapsulated, and slightly encroaching on kidney tissue; mulberry calculus, weighing 10 grains, found in pelvis. Left kidney cirrhotic; small superficial aqueous cysts. Right suprarenal capsule of usual size; left not noticed. Bladder normal. Uterus and appendages atrophied. Lower aorta and common iliac arteries showed chalky plates. Left external iliae artery normal; no obstruction. bar glands normal.

The history and necroscopy of this case correspond so closely to those of mollities ossium or osteomalacia that I am inclined to that diagnosis.

The disease is very rare. Dr. Fagge, in his "Principles of Medicine," 1886, states that he had seen but one case, and that in the care of his uncle, Mr. Hilton, at Guy's Hospital, in 1864. Ten out of every eleven cases occur in the female sex, and two out of every three in women, either during pregnancy, shortly after parturition, or about the time of the climacteric. The age is usually between 25 and 35, rarely under 20 or over 50. The cause is speculative, although many cases seem to have a dependence upon dampness. The earliest symptom is pain, varying in seat and character, sometimes "wandering," and then leading the physician to the diagnosis of "rheumatism." Lassitude, irregular appetite and constipation are usual symptoms. Gradually locomotion becomes difficult and the patient is very liable to fall. In consequence of falls, and, indeed, peared in the lower abdomen; menstruation apsometimes even on slight motion, fractures occur, peared regularly and without pain. She could not with little or no tendency to heal, and accompanied, walk, but rode out in a carriage. A few days before therefore, by deformity. Eventually the patient is I saw her she rode out, with enjoyment, but returned confined altogether to bed, becomes emaciated, ex-| fatigued and soon began to vomit. Her upper exhausted, and dies. The duration of the disease is tremities moved involuntarily, and there was a comusually four to six years, but cases are recorded of plete loss of power in the lower ones. A "metaits terminating in death in three months, and again physician" was called to see her and gave the assurlasting for eight, ten, or even fifteen years; in the ance that there was no bodily ailment—the mind case now reported, nearly twenty-one years. I see only was at fault. The assurance was repeated no reason why it may not endure for any period twice a day by the Christian scientist, who on these within the ordinary limit of life.

Why the bones should be thus decalcified and softened, so that they can be readily cut with a knife, is not yet clear. Lactic and carbonic acids both have been assigned as the causative factors. No excess of phosphates or carbonates of lime is found in the urine except incidentally; although, as in this case, calculi are found in the kidney and bladder in many cases. The inorganic portion of the bone may be reduced to 30 per cent., the diminution in lime being much more relatively to that of its combining acid. The compact tissue may become a mere shell; the tary; the tongue dry and covered with a brownish cancellous tissue sometimes seems like medulla, of a coating; there was great thirst; pulse 110, small and deep red color with ecchymoses; sometimes yellow, almost imperceptible at the wrist. The temperature soft and fatty; sometimes mucous and translucent, was not observed. She was very restless, and had This softening may cause deformity of the female not slept more than ten minutes at one time during pelvis and thereby difficult parturition; and the soft- the past three days. At short intervals she vomited ening of the ribs may be so extreme as to stop respiration. The disease differs from rickets in this: tion I found the abdominal walls soft and free from rickets is due to a failure to deposit the calcareous tenderness on pressure. There was a feeling of salts; osteomalacia to the removal of the salts after doubtful fluctuation with dulness at the sides, also in deposition.

Dr. E. O. Shakspeare, of Philadelphia, then addressed the Society upon

SOME NEW ASPECTS OF THE CHOLERA QUESTION SINCE THE DISCOVERY BY KOCH OF THE COMMA BACILLUS.

(See page 477.)

CHICAGO GYNÆCOLOGICAL SOCIETY.

Stated Meeting, Friday, February 18, 1887. PHILIP ADOLPUS, M.D., IN THE CHAIR. (Concluded from page 472.)

Dr. A. Reeves Jackson exhibited TWO DERMOID CYSTS OF THE OVARY.

Case 1.—First seen by me May 27, 1884. Julia C., aged 40 years, was married at twenty, had one child two years later, and no other pregnancy. Commenced menstruating at 17, and was regular after the first year. Always had good health. Five month ago, weighed 176 pounds. Three and a half months ago she took a long walk in the evening, while menstruating. After her return she had a slight chill, and severe pelvic pain, the latter chiefly referable to the bladder, micturition frequent and painful. She seemed never to recover her health; vesical symptoms continued, appetite and nutrition failed; she became rapidly emaciated; a swelling apoccasions sat out of sight of the patient, the headboard of the bedstead separating them. However, the patient and her friends thought she was getting rapidly worse, and 1 was asked to see her. At the time of my visit she was lying in bed on her back. Her hands and arms were in constant motion; she seemed powerless to keep them still a moment; she could make no co-ordinate movements, indeed had no control whatever over either the upper or lower extremities; the latter were, however, motionless. The functions of the bladder and bowels were voluna greenish, frothish, tenacious fluid. On examinathe right iliac region. The higher parts of the abDrs. Brower, Danforth and E. Ingals.

sue was centered in this space. The amount of hair ovarian cyst. was large, as you see. This was matted together in the usual manner, and has been freed from the sebaceous matter which accompanied it by shaking it in ether. This is a miniature switch made by an with illustrations from specimens: artist in such matters from a portion of the hair. about them.

noticed a swelling the size of an orange in the right cysts in those genitary glands. iliac region. It was soft, smooth, movable and inside; five days ago, after sneezing, experienced a adopted by Waldeyer. Epithelial cells of the ovary, was extirpated on the 25th. It weighed about eight cysts in the ovary, and would not enable us to underhave never observed before in either of the cases I and is in conformity with Cohnheim's theory of the have seen. It is this, there are two distinct kinds origin of all other new formations, from an isolated of hair, one of an auburn color, very curly, portions group of embryonal cells, dormant until the unknown of which are still attached to the part, and two tufts cause of the new formation calls them into formative springing from other portions of the rough, orange- activity. while they have usually differed in color from the pa-texpect to have had more than one embryonal matrix,

Finally, it commenced to grow and it was discovered that its source was a partially col- formed a tumor sufficiently large to attract her at lapsed cyst, which still held about one pint of pus, tention. There were two cysts. The first one was and from the opening through which the pus came a very large one, containing a semi-colloid matter there protruded a few hairs. This fact settled the very much resembling soft soap, and in great abunddiagnosis. The woman had died of a ruptured derance. Separate and distinct from this there was a moid cyst. The kidneys showed evidence of chronic cyst not larger than a goose's egg, soft, and which disease. The cyst with the ovaries and Fallopian could be indented readily, and when it was opened tubes, was removed. Here I show you the opening, there came out a mass of hair together with other which was somewhat enlarged after the autopsy for dermoid characteristics. So it seemed that the cyst the purpose of freeing the inner portion of the cyst, which contained the fluid and made the growth per-In addition to the hair there were also some rudi-ceptible was secondary, and this fact would account mentary teeth and some plates of bones which I for the clinical fact of these patients carrying a sent to a pathologist for examination, and received tumor for many years without any impairment of from him a photograph showing the bony constitu- health, until an additional cyst is formed, that may ents of the cyst. Apparently all of the dermoid tis- present any of the characteristics of an ordinary

> Dr. Christian Fenger made some remarks on DERMOID CYSTS OF THE OVARY,

In entering upon the question of the dermoid These dermoid cysts, of which I have now seen cysts of the ovary, I wish to call attention to the three, possess great interest to me, pathologically, two theories of their origin. According to Heschl, I confess to not understanding them, so I asked dermoid cysts in general owe their origin to isolated Professor Fenger to be here to night, and he promislands of the epiblast, displaced during embryonal ised to bring some additional specimens and to talk development and located somewhere in the territory of the mesoblast. This theory of feetal inclusion did Case 2. Dora B., 35 years old, wife of a physician not explain the origin of the dermoid cysts in the residing at Normal Park. Saw patient on February testicle and ovaries. It was not until his had shown 10, 1886. Married fourteen years; two children, that the internal genital organs are developed from age respectively 11 and 7 years; also two abortions, a part of the embryo, the so called "axenstrang," in one three years and the other two months since, which all the germinal layers are included, that we Nine months ago, while lying on her back, patient were able to understand the presence of dermoid

The second theory of the origin of dermoid cysts sensitive; has slowly encroached on the opposite in the ovary is the view of the older authors, recently sharp attack of pain in pelvis which lasted twenty- capable of transformation into the ovum with all its four hours, keeping her in bed. I can understand that this, in its mass of hairs and sebaceous matter, so that I had turbulent way of forming tissues without an etiologsome difficulty in keeping the abdominal cavity ical object, could cause the physiological resistance clean. However, she recovered without any greater to disappear, and thus open up the gates for maligtrouble than a little abscess in the abdominal wall nant tumors. from one of the sutures.

Before demonstrating the specimen I wish to make entitled: a few remarks in regard to malignancy of dermoid cysts. As a rule, we regard a dermoid cyst as a VAGINAL PRESSURE IN THE TREATMENT OF CHRONIC benignant new formation, and a malignant character is here a rather rare exception. We make a distinction between malignancy of a dermoid cyst, per se, and malignancy from a combination of dermoid pelvic disease by vaginal pressure, we may avail ourlaczek relates a case, operated upon by Martini, in in the treatment of pelvic disease than massage. which, besides a common dermoid cyst with a pernumber, the size of a millet seed and of a yellowish were in reach of vaginal pressure. color. a vastly superior treatment. I was much impressed lieved. There is a mechanical obstruction to the efficacy of this method of treatment. return of blood from the uterus, and what is done by the tampon is to push up the uterus and permit its decongestion, and along with that comes the improved nutrition of the organ, and the reflex symptoms in the way of pain, menstrual disturbances and the like readily disappear. I cannot tell exactly how I was put upon this method of treatment; I don't claim that it is anything new. Several years ago Dr. Bozemann, of New York, tamponned the vagina, calling it "columning the vagina. He spoke of several cases of positive elongation of the posterior wall of the vagina with this continual pressure. His paper was published in full in the transactions of the American Gynecological Society.

Dr. H. T. Byford: I agree with Dr. Etheridge, that any pressure that can be made by the vaginal pressure upon enlarged veins in any part of the body, as in the leg or testicle, is only temporary unless some other curative influence be added. Nor do I think that a low position of the uterus causes the Emmet's operation. venous stasis, for this is not found in all cases, and often is found when the uterus is held high up by contracted and indurated sacro uterine ligaments. modification. The veins are large, long and tortuous, and are

OBSTETRICAL SOCIETY OF PHILADELPHIA.

Stated Meeting, March 3, 1887.

THE PRESIDENT, THOMAS M. DRYSDALE, M.D., IN THE CHAIR.

(Concluded from page 443.)

Dr. Howard A. Pardee read a paper entitled PERINEORRHAPHY AS PERFORMED BY DR. W. GILL WYLIE,

(See page 432, JOURNAL of April 16.)

DR. PARISH had for years performed a similar operation, but carried his denudation farther up the pack could not cause the relief. The benefit of vagina, and thus avoided the formation of a pocketlike place in which discharges accumulate. He has found it in some cases a cure for constipation.

Dr. Baldy did not think Dr. Pardee understood

Dr. Price prefers Emmet's operation.

Dr. H. A. Kelly thought this an unsatisfactory

Dr. Pardee was well acquainted with Emmet's

operation as performed two and a half years ago, with the character of the discharge, rendered it cerhealing.

Dr. Joseph Price exhibited a specimen of

DOUBLE PYOSALPINX, WITH COEXISTING OVARIAN CYSTOMA ON BOTH SIDES.

Mrs. H., æt. 30 years, two children, labors normal, complains of irregular and profuse bleeding; constant pelvic pain, greatest on left side. General health poor. Examination revealed a small fibroid on posterior wall of the uterus; a cyst on the right side extending high up, inflammatory masses laterally. Operation, section. The appendages on both sides were distended by pus and generally adherent, left ovary cystic and suppurating, and matted to the pavilion of tube and the sigmoid flexure. The right ovary was cystic and adherent to the vermiform appendix. The pelvis was filled with an irregular conglomeration of cysts and pus-tubes, intimately adherent to pelvic organs, and overlying all this were the bladder and omentum, also firmly adherent. The omentum was perforated at two points, and the mass was removed by careful dissection. A glass drainage-tube was used. Recovery was rapid and perfect; no opium, no catheter, tube out on fourth day, stitches out on seventh day.

Dr. W. H. Parish reported a

PORRO-MÜLLER OPERATION,

performed by Drs. O. H. Allis and W. H. Parish labor seven days when Dr. Allis was telegraphed for stetrics. by Dr. Groom, of Bristol, Pa., in whose care the patient had been. The membranes ruptured four hours operation has been performed in the United States after the pains began. On the sixth day the pains in cases of impaction of the fœtus in a transverse became more severe and the cord prolapsed. About position twelve times. In eleven cases the feetus the same time a hand protruded from the vagina, was dead. In the twelfth it was saved, but the oper-The child died about this time. Of the twelve cervix was rigid and but slightly dilated. It seemed cases nine, or 75 per cent., recovered. Of the three impossible to deliver the patient by either cephalic cases lost one was ninety-six hours in labor, three or podalic version, and the conclusion was made days in charge of a midwife. Another wes twentythat evisceration was not advisable, because there six hours under a midwife who had given ergot and was every reason to believe that the uterus had done ruptured the membranes; and the third had been itself irreparable harm by reason of its prolonged long in labor, but time not stated. Her death was retraction against the eminences of the child. The caused by fright and exhaustion; she rose from her contusion incident to the retraction and the admis bed to defend her mother against her husband, who sion of atmospheric air over a period of seven days, had come home drunk on the third day. He knew

The obliteration of the rectocele in that operation tain that gangrenous changes had been going on in was by drawing down a stretched wall, leaving it thin the endometrium and placenta, and that septic inover the rectocele. In his experience opium had not flammatory action of the uterine lymphatics had albeen needed after the operation to control pain. The ready begun. The patient was in a condition of external stitches are needed to secure a neat external exhaustion. Evisceration alone would not have sufficed to secure delivery; it would have been necessary to have bisected the child in the lumbar region and to have removed separately the lower and upper sections. The condition of the uterus and the small size of the pelvis would have rendered this procedure a lengthy and an exceedingly difficult one, and would have added additional serious injury to the uterine tissues. The removal of the child would have left a putrefying endometrium and septic lymphatics. I felt certain the patient would die if thus delivered. All present thought Caesarean section indicated. The operation was performed by Dr. Allis. The uterus was elevated from the abdomen and a rubber tubing was placed about the cervix, securely controlling the hæmorrhage. Escape of fluids from the uterus was guarded against by means of warm antiseptic pads adjusted about and over the abdominal incision. A vertical incision was now made, and the child extracted without difficulty. The placenta was not in the line of incision and there was no hemorrhage. Two transverse pins were carried through the cervix, and a constricting wire was substituted for the rubber tubing about the junction of the cervix with the body of the uterus. With the uterine body were removed also both broad ligaments and their contents. The uterine stump was secured externally by means of the transfixion pins, and wounds closed by carbolized silk sutures. Antiseptic measures were taken throughbecause of an impacted shoulder presentation. Mary out the operation, but the spray was not used. FOREIGN CORRESPONDENCE

SURGERY IN LIVERPOOL AND MAN-CHESTER.1

I spent two days in Liverpool, and became personally acquainted with Rushton Parker, Reginald Harrison and Mitchell Banks. Parker lectured on "Sarcoma" to a class of fourteen students. Looking at his class list I noticed twenty-seven names. lecture was delivered in a colloquial style and gave evidence of a good clinical acquaintance with his subject, but no deep points in histology or pathology were elaborated. I visited with him the Royal Infirmary and the various departments of the University, which is located in close proximity to the hospital. The chemical branch of this institution was erected and endowed by some of the rich manufacturers of the city, and is a model of usefulness and used, as I was told, more for the purpose of irrigating

Harrison is a man of middle age and is an enthusiast in his specialty. He showed me several cases of rupture of the urethra followed by extravasation where he had made external urethrotomy and incisions through the infiltrated tissues. He places great stress upon the necessity of removing the extravasation by firm compression, relieving the tissues at once of the fluid in the same manner as squeezing a sponge. The result of this procedure is to prevent sloughing the risks of subsequent infection during the frequent and hastening the suppurative process. He drains the bladder only for a few days with his drain. He is a firm advocate of boutonnière for diagnostic and therapeutic purposes. He looks upon this operation as a trivial procedure almost devoid of danger. He introduces the drain along the groove of a Wheelhouse's gorget. He also demonstrated upon several cases the advantages of his "whip bougie." This instrument is about twenty inches in length, and if previously warmed is so flexible that it doubles upon itself, when fully introduced, without doing damage to the walls of the bladder. As the instrument is conical in shape, one introduction is followed by the same degree of dilatation as the introduction of a

of but one case of impaction in Europe in which the number of the ordinary filiform bougies. He favors Porro operation was performed, but in this the pelvis treatment of strictures of urethra by gradual dilata-

> He is not favorably inclined to the crushing operlateral operation done a few days before where the wound had almost completely healed.

> In plastic operations upon the urethra he performs a preliminary measure. You can readily conceive secures to the wound the two essential conditions for to prevent leakage between the drain and the soft

> In hypospadias and epispadias he makes the new urethra by tunneling the tissues from the apex of the glans penis to the abnormal opening, and secures patency for the new channel by introducing a drainage-tube until the healing process is completed. a last step the abnormal opening is accurately closed over a catheter and the urethral continuity is restored. To guard against subsequent constriction of the new canal the patient is instructed to introduce a goodsized bongie at least once a week.

Mr. Banks operated upon a case of carcinoma of the breast, and although the axillary glands did not appear to be involved, a clean dissection of the axilla was made to the axillary vessels. Wherever a vessel was recognized it was ligated at two points and divided between the ligatures, consequently very little blood was lost during the operation. A spectator was readily convinced that the operator had been for years a teacher of anatomy. Spray was the wound than for its supposed effect in sterilizing the atmosphere. The wound was completely closed with silver sutures and drainage established in the lower posterior recesses of the wound. As an antiseptic dressing sublimated wood wool cushions are are used. I received the impression that dressings are too frequently changed in this hospital, thus depriving the wounds of that perfect rest required in a typical wound healing and exposing the patients to dressings.

Mr. Banks also operated upon a lad who had received a scalp wound nearly three months ago. No brain symptoms were present after the injury or for some time subsequently. During the last few weeks rise in temperature, slight supportation of wound. For the last few days greater rise in temperature, vomiting and sopor; both pupils contracted. site of injury over the left frontal region the wound presented a granulating appearance and a probe could be passed through a small aperture into the skull. Probable diagnosis, suppurative pachymeningitis. The field of operation was earefully disinfected, and while patient was under the influence of chloroform the opening in the bone was enlarged with bone forceps. The dura bulged into the wound and did not

HOTEL RATES.

The following hotels in Chicago have thus far commuted their rates to delegates and members and their families who will attend the annual meeting in June —all promising first-class accommodations:

Grand Pacific Hotel.—A discount of 50 cents to each person per day in all rooms, except those at \$3.00 per day, on which there will be no discount. By this arrangement a \$3.50 room with bath may be had for \$3 00, a \$4.00 room for \$3.50 for each person, and so on. A club room will also be placed free at the disposal of the Association for headquar- Heffenger, A. C., P. A. Surgeon, U. S. N., ordered to Widow's ters, if desired.

The Sherman House will give 50 cents per capita off regular rates, which are \$3.50 to \$5.00 per diem, as well 50 cents per capita off \$3.00 per day rooms

Such A. Hengst, Pittsburgh, Pa.; Dr. Theodore Hering, committee rooms, etc., as may be required will be

The Tremont House offers 50 cents discount from

The Palmer House gives a rebate of 50 cents per A. W. Orwin, London, England; Dr. M. C. O'Toole, capita on the American plan, when two occupy a San Francisco, Cal.; Dr. Wm. Porter, St. Louis, room. On \$1.00 rooms, (European plan) a rebate Mo.; Dr. D. N. Rankin, Allegheny, Pa.; Dr. J. M. of 25 cents per capita where two occupy a room. On Ridge, Camden, N. J.; Dr. J. O. Roe, Rochester, rooms for which the rate is \$1.50 and upwards, a N. Y.; Dr. John A. Robison, Chicago, Ill.; Dr. O. rebate (on the European plan) of 50 cents per capita

The Briggs House.—The rates will be \$2.00 to

The above hotels are located within a few blocks of Central Music Hall, the place where the general (forenoon) sessions will be held. Additional informa-W. McNeil Whistler, London, England; Dr. Edward tion as to hotel rates will be published in subsequent issues of The Journal.

> RAILROAD RATES for delegates will be published in full next week. They will be one and one-third $(1^{1}3)$ fare for the round trip issued on the certificate

plan, as follows:

Tickets for return journey will be furnished those having paid full fare to place of meeting who procure tickets not more than three days before the Association assembles, if presented within three days after the date of adjournment. Some forty different railroads of the country having already agreed to accept return tickets issued under this plan. The names of these railroads will also be published in next weeks' issue of The Journal.

CLINICAL LECTURE

THE GENERAL PRINCIPLES INVOLVED IN AMPUTATION,

With a Consideration of Some Points in the Technique.

BY FREDERIC S. DENNIS, M.D.,

[REPORTED BY SEYMOUR H. HOUGHTON, M.D., HOUSE Surgeon, Bellevue Hospital.]

once said that "we must reach such a state of per-lution of this problem. Delay in performing an amfection in amputation as to consider every amputa-putation was formerly fraught with very great danger tation a plastic operation;" and with a view to the from septic infection; but with the modern methods attention to this subject in the lecture to day.

needless addition of suffering to the patient on ac-septicæmia. count of the operation.

consistent with safety. Now, what is to guide the has been shown to have a causative effect on the surgeon in his decision of so important a question? death rate. Hewson has shown that with a rising In cases of compound comminuted fracture, with in-jury to the main artery of the limb and with great cases was only 7 days, while with a falling barometer

hæmorrhage is often alarming, and amputation is called for imperatively as the only salvation for the patient. What is the earliest moment a surgeon should operate? Never during profound shock; and the rule which must govern a surgeon is, to employ all known means to control hæmorrhage and to bring about reaction from shock, and wait. If the patient has pallor and coldness of skin, weak and feeble pulse, sighing respiration, non-reacting pupils, trau-PROFESSOR OF THE PRINCIPLES AND FRACTICE OF SURGERY IN THE matic delirium—internal injuries, no amputation is indicated. The earliest possible time an amputation can be performed, under great necessity from hæmorrhage, is when reaction is beginning; but unless Gentlemen: The late Sir Wm. Fergusson used to the patient is likely to become exsanguined by delay speak of amputation as "one of the meanest, and yet the beginning of reaction is an unfavorable period one of the greatest operations in surgery; mean for operation, and it is wise to defer it until reaction when resorted to if better may be done-great as is fully established. Amputation should not be perthe only step to give comfort and prolong life." In formed with a sub-normal temperature, a cold skin, studying the conditions under which amputations a feeble rapid pulse, or during traumatic deliriumhave been resorted to during the past half century, especially in children. The condition, then, of the it is astonishing to see how limited in number those temperature, the skin, the character of the pulse and conditions are at the present day. Szymanowski the mental state, are all important factors in the soaccomplishment of such an object I desire to direct of preventing sepsis in a recent wound, this obstacle is removed; and with antiseptic compresses applied There are four periods at which an amputation can tightly over the bleeding wound, and not above the be performed: 1. Immediate—before reaction from wound upon sound tissue, hæmorrhage can be conshock; 2. Primary—after reaction but before inflam-trolled and the wound kept from rapid sepsis a suffimation; 3. Intermediate—after inflammation but be- cient time to give the patient opportunity to react. fore suppuration; 4. Secondary--after suppuration is Thave seen an Esmarch elastic bandage applied above established. For all practical purposes these four a lacerated wound, over sound tissue, and when the periods can be reduced to the primary and secondary. flaps were made a certain amount of sloughing fol-As a rule, to which there is scarcely an exception, lowed from the compression. The wound itself is the the immediate amputation should not be performed, proper place to apply firm compression, never above as the patient is likely to die from shock during the the seat of the wound. This point is one of practioperation. The double shock of the operation and cal importance, because the elastic bandage as a of the injury is apt to kill the patient; and the means of controlling hæmorrhage has been misused; shock of the injury of the limb may be complicated instead of applying the compression over the bleedwith shock from injury of some important internal ing part, it has been carried above the bleeding part organ from which the patient could never rally, and and over sound tissue. As a result of this, ganhence the impropriety of the amputation, and the grene in the flaps may occur, with its accompanying

The mortality of amoutations depends upon a It is sometimes necessary to amputate as soon as variety of conditions; even the state of the weather loss and destruction of tissue in the soft parts, the the average duration was 13 days; and that 75 per

cent, of the fatal cases died when the barometer was formity—above all and beyond all the hygienic conrising. The conclusion is that, while the state of the ditions stand out foremost; and if we exclude serious any given patient after amputation, barometric arrangements. Sir James Y. Simpson showed that five changes materially influence the condition of patients times as many deaths occurred after amputations in

life, and that at any given period after 30 years of principles of science to surgery. We will now disage the risk is more than twice as great as it was at the same period after birth." Thus if, for example, it may be stated that 5 per cent, is the mortality after amputation in a child at 10 years of age, the mortality at 40 years would be 10 per cent.

The *seat* of the amputation is also an important factor. Amputations of the lower are more fatal than those of the upper extremities. In any given limb the death-rate increases in reference to the proximity of the amputation to the trunk. Thus if, for example, amputation of the thigh be represented by 50 per cent., the leg would be 40 per cent., the arm 25 per cent., the forearm 13 per cent. These figures are far too high since the introduction of antisepsis, but are quoted to show the relative figures in the different amoutations.

The part of the bone sawn through affects the mortality. The mortality is greater where the shaft is divided so as to expose the medullary canal than where the cancellated tissue of the bone is sawn through; for in the former case, the risks of pyæmia and osteo myelitis are greater than in the latter case.

The primary amputation is much more fatal than the secondary. Sir James Paget states that the mortality is 12 times greater in the former case. This rate is perhaps too high; but the fact that the primary amputation is attended with a greater death-rate is due to the severe character of the injury. It has been stated that the amputation of expediency, performed for the relief of deformity, is attended with a greater mortality than either primary or secondary amputations.

The general health of the patient importantly influences the success of an amputation. The condition of the kidneys, lungs, heart, and vascular system, liver, brain, and other important organs, materially affects the results after amoutations.

tant factor. A man of dissipated habits has his tation in general the following points are to be conchances of recovery lessened by his profligate life, ' while the temperate man has his chances of recovery greatly increased. Pneumonia often causes death after amputations in those cases where the patients operation. have been hard drinkers for many years.

The hygienic conditions are most important in affecting the mortality. Patients in the country do better than those in the city, and the latter do better ation. in private practice than in hospitals. Always secure for a patient abundance of fresh air and plenty of

weather may or may not turn the tide for or against organic disease, nothing is so important as the sanitary suffering from the effects of severe surgical opera-large city hospitals as in private and country practice. tions, and have a slight influence upon the death rate. To day the mortality in amputations is very much Age is also a factor in estimating the mortality less than in his day, and a large majority of the causes after amputations. Holmes has proved "that the of death following amputations may be said to have risk of amputations is constantly rising throughout been forever eliminated by the application of the cuss the indications for an amputation:

Aneurism.

Malignant disease.

Perforating ulcer of foot.

Uncontrollable hæmorrhage (primary or secondary).

The operation of expediency in deformity, in tumors and tetanus.

A disease of the joint.

The moist variety of gangrene.

In certain compound fractures and dislocations.

Old sloughing and varicose ulcers. Necrosis of bone.

These ten indications for amputations have thus been arranged in an acrostic, which will always enable the student or surgeon to have at his command the information.

REQUISITES OF A GOOD STUMP.

I. The bone must be amply covered.

2. The flaps must not be adherent to the bone nor exert pressure on traction upon the cicatrix.

The nerves must not be adherent to bone or cicatrix. 3. The nerves must not be adherent to bone or cicatrix.4. The nerves must be cut high enough so as not to be affect:

by pressure or by atmospheric changes.

5. The bone must be smooth and capable of bearing firm pressure upon it.

CHARACTERISTICS OF A BAD STUMP.

I. Necrosis at end of bone.

Sequestrum from injury to bone in sawing, by rough use of saw, by suppuration in bone by injury to periosteum, by sawing without irrigation to prevent the saw from acting as an actual cautery.

2. Conical-shaped stump.

Insufficient covering, spasmodic retraction of muscles, growth of bone.

3. Neuralgia of stump.

External pressure, local and constitutional causes, bulbous enlargement, adtional cause., hesion to cicatrix.

We may now direct attention to a careful study of the technique of the operation in its present perfected The previous habits of the patient is another importante. For the purposes of description of an ampusidered in an amputation of the leg:

First—Preparation of patient.

Second - Provision against hæmorrhage before

Third—Formation of a suitable flap.

Fourth—Section of the bone.

Fifth—Provision against hamorrhage during oper-

Sixth—Treatment of wound.

The preparation of the patient consists in a careful sunlight. Too much stress cannot be placed upon study of the patient's history, and also the special his hygienic surroundings. While the weather, age preparation of the member to be removed. Before of patient, seat of amputation, the part of the bone the operation the heart and lungs should be examsawn through, whether for injury or disease or de-ined, the urine analyzed, the general habits of the

patient inquired into with reference to intemperance, tive duties and he must not interfere with the duties and opium habit, or previous disease, and other points of the others; thus the operation from beginning to of interest which influence the treatment after oper end will be executed in perfect order, and with the ation, as well as the mortality. In other words, the least possible delay or suffering. The nurse should surgeon should study thoroughly the individual upon wash and wring out the sponges used during the whom he is to operate, and make himself complete operation; and what has been said of antiseptic master of the situation. The local attention to the preparation of the assistants must include the nurse. part consists in thorough ablution, shaving, and free irrigation with carbolic acid or bichloride of mercury to be removed, so that he can hold back the flaps solution.

minutes, and at the same time rubbed towards the turned towards the part of the limb to be removed, trunk. The tourniquet should be now placed over and never towards the flap. In this way he cannot the femoral just beneath Poupart's ligament, so as to button-hole the flap, and the edge of the flap being press against the bone. It should be screwed down out at right angles to the long axis of the limb, will not quickly upon a bandage placed under the bone and slough, as it will do if the edge is cut obliquely. The over the artery; if it is slowly turned a large amount flap should consist of skin and connective tissue and of blood will pass into the limb, and the compression deep fascia down to the muscle; but it is not to inis soon sufficient to keep the venous return in the limb, clude the muscle. The blood vessels nourishing the but not enough to prevent arterial blood from entering thap run between the skin and the deep fascia, and if the limb. Esmarch's bandage is often used instead the edges of the flap be cut at right angles and not of Petit's tourniquet, but the amount of oozing fol-obliquely, the extreme edge of the flap is bountifully lowing its use is so great that I prefer digital pressure supplied with vessels. In dissecting up the flaps they on the tourniquet, when properly applied. If the should be held by the surgeon's fingers, and never by ligated, the irrigation by hot water, as suggested by ing dissected up the flaps to a convenient distance better than any other means. If the hot water is now prepared to make a circular section of the musemployed for this purpose I should recommend that cles down to the bones. a weak solution of carbolic acid be prepared in anticipation, or else a mild solution of corrosive sublibecut, as suggested by Linhart, of Würtzburg. The mate (say 1-4000). These solutions have the addi- object of the interosscous membrane flap is to pretional advantage of making doubly sure the aseptic vent the retraction of the tissues which carry the condition of the flaps.

stances often influence the surgeon as to the kind and two inches parallel with the bone. The catlin should shape of flaps in any given case, but if he can now cut across until it comes in contact with the operate at a point of election instead of a point of edge of the fibula, and then upwards along the edge necessity, either the circular skin flap, modified, if of the fibula to a point opposite to where the first innecessary, by two lateral sections, which converts the cision was made. This will cut out a tongue-shaped amputation into one of an antero posterior skin flap piece of tissue composed of the interosseous memposterior flap, or the bilateral flaps, will be found best tibial artery is found. This interosseous flap retracts in all amputations. Whatever shape may be decided more readily than muscles, and consequently, being body where pressure is made against bone, skin alone stump. covers the part; the os calcis and the olecranon, the larger wound for healing.

The flaps should now be approximated and the sutures tied. as soon as they show evidence of the slightest irritasome oozing may occur. This is controlled by hot thin film of iodoform can be sprinkled over the line antiseptic sponges wrung out in hot bichloride of pital gauze lightly placed over the stump. The gauze next to the wound should be wet, having previously After hamorrhage is completely arrested and the stood in a hot solution of bichloride of mercury or carbolic acid. The gauze should be wet, because a most important subject, viz.: the treatment of the The absorbent cotton can be now placed over the entire stump and held in place by an antiseptic bandage. Over this dressing layers of antiseptic gauze can be placed with the Mackintosh; the latter can

These details of wound treatment have already been discussed in a previous lecture, a report of which may be found in The JOURNAL of August 21, 1886, and it is unnecessary to repeat what has been said in regard to the technique of an aseptic surgical operation.

Some surgeons have objected to deferring the permanent dressing several hours because the patient has come out of the influence of the anesthetic, and the final dressing must be done while the patient is conscious. The objection is overruled if the sutures are introduced through the flaps but left hanging loosely. There is no pain in the mere approximation of the flaps.

on a splint and bandaged to it.

dressing can remain unchanged for a week, and then septic poison. a new and final dressing can be applied. It is thus evident that by this method all the great principles mary union in all amputations by using every detail of wound treatment have been observed.

In exceptional cases, however, it is not best to close the wound because primary intention can not be obtained on account of the peculiar conditions of the wound. In cases of compound fracture, attended with great crushing of bone and soft parts, there judgment and a due regard for the best interests of is occasionally some contusion over a small area of the patient has persuaded you to adopt the method the wound, which might prevent primary union, but which is less brilliant in its technique, but more brilis not sufficient to prevent a satisfactory healing by secondary intention, and thus securing a longer stump. Another circumstance where closing the wound is not best, is in an amputation of emergency, at a place where antiseptic dressings can not be secured immediately. I believe that under such circumstances no attempt should be made to secure primary union, because all the essential conditions are absent, and a failure under these circumstances would expose the patient to serious risks from septic infection. Half-way antiseptic surgery is more dangerous than full exposure of the wound to the air. I believe that leaving the wound fully exposed to the air is not only safe, but is in reality the best method where all the conditions of rigid asepsis cannot be controlled. During the past session I have treated two stumps by the open method, and both of them did just as well as regards constitutional disturbance as the others. The open method has one disadvantage; the wound does not heal so quickly; but it heals satisfactorily in the end. In the open method the highest type of antiseptic surgery is found. The frequent use of carbolic acid renders the soil unsuitable for the growth of germs, the causes of putre-The unobstructed flow of the discharge prevents the secretion becoming putrid. The exposure of the wound permits evaporation, which renders the discharge too highly concentrated for the favorable growth of these germs; and, finally, as Pasteur has shown, this same free exposure, by the supply of oxygen to the microorganisms, prevents their disorganizing and breaking up the albuminous compounds in their struggle for one of the essentials. The preservation of the albuminous of their being. compounds diminishes, and even prevents, the processes of putrefaction. The exposure of the wound lessens the chances of decomposition by causing it or at the residences of patients, a certain range of to become dry.

PNEUMATIC DIFFERENTIATION AND THE PNEU-MATIC DIFFERENTIAL PROCESS. ITS DEFI-NITION AND GENERAL SUGGESTIONS FOR ITS APPLICATION.

> BY HERBERT F. WILLIAMS, M.D., OF BROOKLYN, N. Y.

The term "pneumatic differentiation" was first used by the author, in an article which appeared in the New York Medical Record, January 17, 1885. In this article, or in a subsequent one, certain improvements were spoken of which promised to enlarge the scope of the process there described. This paper is written for the purpose of giving a fuller description of what has now come to be known as the "Pneumatic Differential Process."

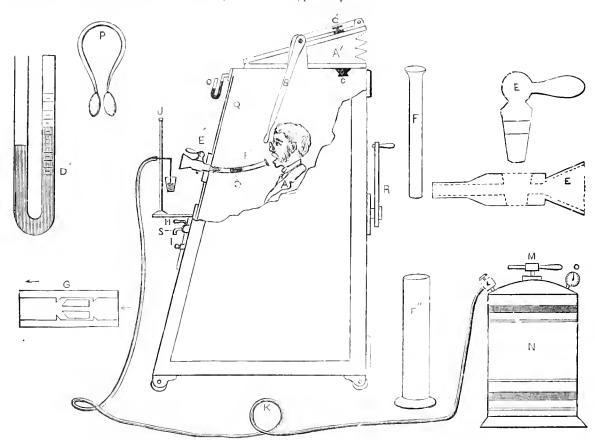

Pneumatic differentiation is the mechanical expression of the thoughts and ideas of two men, a physicist and a physician. However parallel their work may have been to earlier investigators, the labor has been entirely independent, and perhaps for this reason there comes a point of divergence which carries their investigations considerably beyond the labors of Hawk, Lange, Junod and Waldenberg. The cabinet in the hands of lung specialists is capable of nice and skillful adjustment to the various anomalies and contortions that are found where diseased action has not been impeded, and under the control of such in hospitals, sanitaria, cases will yield to treatment that might fail of per-There is no real inconsistency between antiseptic manent benefit in office practice. But the cabinet surgery, as now understood, and treating a wound and its operation are equally well designed for the openly. The rarefaction may be from wide, thereby withdrawing about $\frac{1}{30}$ of the atmosmouth, and if the higher rarefaction is used the and producing a corresponding depression in the breathing faucet is partially opened and the weight mercury. The accessory stop-cock is now opened of the normal air seeking to establish an equilibrium to allow air to rapidly flow into the cabinet, when with the expanded rarefied inter-pulmonary air, will equilibrium is again established, which will take produce an easy and effectual expansion of the place in a few seconds, the accessory stop-cock is lungs. The expiratory act may be made into the closed. The word "out" is called, and the patient cabinet. This will decrease the rarefaction in the makes an expiration. The operator recovers the cabinet, and as each respiration proceeds, the breath- lever and compresses the air in the cabinet to the ing aperture in the faucet may be opened wider, or limit of the contents of the bellows, which drives the rarefaction may be kept high by an occasional the mercury up the left arm of the manometer. stroke of the bellows. At a pressure of from 120 to These movements can be repeated from five to $\frac{6}{10}$ the patient may proceed to the third act.

by maintaining continued respiration through the breathing tube during the contrasted air pressures.

This converts the normal active inspiratory act into a passive movement, while the ordinary passive expiration becomes active to a degree dependent upon the extent of differential pressure. The noseclamp should be used in this act if the posterior pharynx cannot be controlled, to prevent the escape column of air, which after two or three inspirations the reverse of the inspiratory differential act. secures a constant and even expansion from buccal expel the lower differential pressure will be inade, per minute. quate to overcome the increase. It is not necessary, however, to remove such a large quantity of air at Residual Air Compression. It differs from the last once, for, by the gentle and occasional operation of act in that the patient makes a full inspiration at the bellows, the rarefaction can be maintained, con- equilibrium then closes glottis, when the operator stantly at one point.

IV. Respiratory Differentiation.—This has become the principal act of the entire process2, and its scope will not be reached until we are provided with eral acts.—Each patient is to be furnished with a special apparatus for the operation of its full princi- separate breathing tube and jar, labelled for identifiple in producing artificial respiration in all forms of cation, which is to be filled with an aseptic solution suspended animation.

For the treatment of pulmonary disease an excur-

makes an inspiration. The operator at the same in-II. Forced Inspiration .- The valves c and c' to stant depresses the lever and opens the bellows 10 to 2 inches. The patient now takes the tube in his phere less the cubic displacement of the patient, fifteen times per minute. The inflow or outflow of III. Inspiratory Differentiation, which is effected the respiring air can be retarded by the use of the artificial reversible glottis as already described. Further reference to this will be made in treating of its application to diseases. Should the entire contents of the bellows produce too great a force, the patient may commence respiration with the bellows half open, when its operation, as before, will give a reduced variation each way.

V. Expiratory Differentiation.—The valves c and of air, which will not only lower the rarefaction, but 'c' are arranged to produce pressure inside the cabmore seriously interfere with the full intent of the inet, with $\frac{2}{10}$ to $\frac{4}{10}$ the patient will find his inspiration act, which compels the respiration of an elastic difficult and his expiration easy, just to the extent of

VI. Forced Expiration.—Valves e and c' same as cavity to the remotest alveolus. Radiation of body in last act, high pressure from 1 to 2 inches is proheat or any slight escape of air into the cabinet will duced in the cabinet. The patient takes his inspiraafter a few moments reduce the rarefaction, but this tion from the cabinet air, but makes his expiration can be kept up without disturbing the treatment by through the breathing tube, which the operator must the withdrawal of the air syncronously with the in-close while the patient is inspiring. The bellows spiratory act. If air is withdrawn from the cabinet must be operated to keep up the pressure in the when the patient is making an expiratory effort, the cabinet, for the patient is now reducing the pressure amount of energy which he unconsciously exerts to by the emptying of his lungs ten to twenty times

> To these six acts another might be added, viz: rapidly produces pressure from 1 to 2 inches. This is exactly the reverse of Residual Air Expansion.

> General suggestions for the application of these serin which the breathing tube is to be immersed when not in use. The breathing faucet should be cleansed and disinfected after each treatment; the cabinet should be kept cleansed and frequently disinfected.

closed. The air should at least be fanned out after ention and forced expiration, with high pressure, each treatment. Cuspadores should be cleansed should be the principal treatment. In simple larand disinfected after each treatment—or separate yngitis, trachetis, and bronchitis, inspiratory differenones supplied each patient. The patient should be tiation, forced inspiration, with low vacuum $\frac{1}{10}$ to $\frac{1}{10}$, so placed in position that a good free movement of where spray is projected by means of forced inspirathe thorax and abdomen can be made. The height tion, calculation must be made upon its deep penetraof the chair and the distance from the breathing tion, and sedative, lubricating and emollient agents tube should prevent the possibility of the patient ac- alone should be used. Hot spray is more grateful quiring the habit of leaning forward while taking to some conditions than the cold blast. treatment. In warm weather or in heated rooms the cabinet doors should be opened occasionally curring in persons of full respiratory power, do not during the sitting, and the patient gently fanned. A well tolerate irritating sprays or vapors, and high towel should be pinned about the neck of the pa- pressures are unnecessary. Patients whose laryntient, this should be of sufficient length and breadth geal, tracheal and bronchial mucous surfaces have beto cover the lap, abundance of these should be pro-come inured to the frequent passage of catarrhal vided and a fresh one supplied for each treatment. Every detail of refinement not only catches the attention of the patient, but gains his full confidence, and guards him against contamination, contagion brane can be inferred. Lugol's solution, 30-50 per and infection.

Patients applying for treatment should be classified | benefit. if possible, into the following divisions: 1. Developmental, a, connection of faulty respiration, b, treated by forced inspiration, or respiratory differencalisthenics; 2. Acute non-infectious; 3. Chronic tiation; inspiratory differentiation may be possible, non-infectious; 4. Acute infectious; 5. Chronic but high vacuum may precipitate a seizure. This infections.

Where it is possible to pre arrange sittings, patients suffering from acute affections should follow each other, and precede the chronic cases, and es pecially the chronic infectious cases. Scrupulous lobules following croupous and catarrhal pneumonias, attention should be given to the cleansing and disinfection of the cabinet, and such accessories as has been in use in such cases. Germicidal sprays and vapors should never be omitted in the treatment of infectious (tubercular) cases, even by those who: do not sympathize in the belief of the assertion of differentiation. The sleeplessness of anæmia, anotheir germicidal power.

SUGGESTIONS FOR TREATMENT.

First, as a means of Calisthenics.—Respiratory differentiation should be used at first. This may be conducted with the breathing faucet entirely open, but as the patient's respiratory power increases, it may be but partially open, the alternation of pressures can be made greater, and both respiratory and expiratory acts can be maintained until the pressures are equalized. Should there be a tendency to prolonged expiration, a portion of the sitting should be conducted by forced inspiration with high vacuum and a contracted inspiratory aperture.

The inspiratory muscles may be strengthened by maintaining respiration by expiratory differentiation, with a pressure of $\frac{2}{10}$ to $\frac{4}{10}$, expiratory strength may be acquired by the maintenance of the full inspiratory differentiation. This act should only be used when hæmorrhage has occurred or is anticipated, and in pulmonary congestion. In uncomplicated emphysema gentle respiratory differentiation; expiratory differentiation and forced expiration should be used. When there is complicating bronchial catarrh, the treatment may be interspersed by inspiratory differentiation, or forced inspiration with low vacuum

This can be easily accomplished by allowing the $\begin{vmatrix} 1 & 1 \\ 1 & 1 \end{vmatrix}$ to $\frac{1}{10}$, for the purpose of applying appropriate spray or vapor to flow into the cabinet with the door remedial agents. In bronchiectasis expiratory differ-

Acute inflammations of the respiratory tract ocinflammatory, and degenerative products are more tolerant to the stronger disinfectants, and where ædematous conditions of the bronchial mucous memcent may be occasionally used with impunity and

Ordinary spasmodic neurotic asthma is best act may be made possible by the introduction of a proper anti-spasmodic agent. As to the various functional disorders of the lung, produced by pleural effusions or exudates, the non-aerating lobes and regional blood stasis due to bronchial occlusion. These conditions should receive as preliminary residual air expansion, or compression, or both, followed by respiratory differentiation and then by forced inspiration, and the sitting concluded by inspiratory rexia, chlorosis and the amenorrhoea dependent upon these conditions, will all receive direct benefit from inspiratory differentiation.3 Some forms of heart disease should respond to the same act.

(To be concluded.)

ENTERECTOMY FOR STRANGULATED HERNIA. WITH REPORT OF A CASE.

BY N. B. CARSON, M.D.,

SURGEON ST. LOUIS MULLANPHY HOSPITAL.

Has the introduction of antisepsis into surgery improved the results of herniotomy? It is claimed by some that the mortality has been lessened by antiseptic methods. Hamilton says: "Mr. Hey states that he lost three out of every five cases upon whom he operated, but it is my impression that the mortality remains about the same as when Mr. Hey wrote, nearly one hundred years ago."

Bruno Schmidt, (Leipsig)1 states that the mortality of strangulated hernia before the introduction of Listerism was 45.8 per cent., while the mortality since its introduction has been 36.6 per cent., a re-

⁸E. Tiegel, New Yorker Medizinische Presse, February, 1887.

Here the line of constriction was marked, and no practice, bearing upon the subject in question is of doubt if autopsy could have been made we would more than ordinary interest, I will introduce it here. have found the bowel open where it had been softout feces is sufficient to set a septic inflammation.

infrequent as to require no more than passing notice.

Stricture after strangulated hernia is due to cicatality we find: Shock, peritonitis, paralysis, humor-trization, says Mr. Treves, and follows upon ulcerarhage, tetanus, crysipelas, and pyemia set down as ation, or limited gangrene of the involved bowel. He says he has found four recorded examples of this stricture, in addition to several specimens to be seen paratively speaking, is not very great, while perito- in some of the London museums. This condition nitis, generally septic, plays the most active part; and may follow the relief of the hernia in from one month

Having now considered the causes of death, the ing circulation and while it is still in a pathological question naturally arises how are we to combat them? condition. The following statement clearly explains Gross says: "It has been proposed when mortificamy views: "Strangulated gut returned in the condi-tion has been limited, to replace the bowel on the tion, even if there be no openings, and although it supposition that before the slough can separate, the has been well washed, is still septic, and the secre- parts immediately around the seat of the disease will tions from its surface will set up a septic peritonitis." have contracted firm adhesions to the neighboring Another very frequent cause of peritonitis, and one viscera, thus protecting the peritoneal cavity against that is not anticipated as likely to occur as often as fecal effusion." He very justly doubts the propriety autopsies prove it, is perporation after return. Most of such a proceeding, and says he would certainly cases of strangulation come to the surgeon after the discountenance it. An example on the part of nahernia has lasted many hours and often days, and ture to protect herself is cited by Mr. Treves, wherein after much time has been spent and much damage done. Mr. Travers tied a ligature around the small intesin efforts at reduction. Consequently the bowel is so tine of a dog. The animal died on the third day, altered in structure that it is with difficulty recognized and the ends of the bowel were found to enter a kind when cut down upon. As a result of this, if the part of cyst, formed by lymph from the peritoneum. attention was called to this, but as it had been there peritoneal cavity, and my finger entered an opening before, and had always gone away of itself, nothing in the intestine at its exit through the external ring, was thought of it. The next day, being no better, a; which doubtless resulted from the very slight manipphysician was sent for, who ordered opiates, hot ulation necessary. I then grasped it so as to prevent water injections and warm applications to the abdo- the escape of its contents, and by careful traction men. From the opiates he obtained only partial drew it out through the median opening. I then relief, and the injections brought away only a few discovered that the entire circumference of the bowel scybala. Vomiting of a dark brownish fluid, free had not been strangulated, but only about four-fifths from odor, supervened on the second day, and con- of it, while the remainder had been drawn so tightly tinued up to the time of his coming to the hospital, to the border of the ring as to completely occlude it. When I saw him, in the afternoon, after his entrance The part above the constriction was distended, and into the hospital I found him with a good expression, with a pulse of 100, regular and of good volume, low was collapsed. temperature 98.4° F. The abdomen was distended both above and below the opening, the intestinal and showed plamly the convolutions of the small contents having been pushed up and down, so as to intestine. There was but little pain on pressure. In the right groin was an inflamed tumor about the size of a large hen's egg, painful to the touch and pitting on pressure. The tongue was moist and covered in the centre with a thick white coating, while the edges and tip were red. The bowels had moved last on the morning of the accident. There had been no not urgent I concluded to defer any operative probe present to give their consent.

The next morning his condition had not materially changed. His expression was a little more pinched, his pulse was 112, still regular, but not as good volume as the evening before. Temperature 100° F. The tongue was a little dry, but otherwise unchanged; the abdomen was a little more tense; there was no noticeable change in the tumor, and no recurrence of the vomiting. With the consent of his parents it was decided to cut down upon the tumor, and if the bowel was not already open to incise it and allow the

escape of the fecal contents.

The sack was opened; there was an escape of two or three drachms of sero-purulent fluid. The knuckle of intestine was destroyed beyond recognition. When this was opened, there was an escape only of very offensive mucus and serum. The parts were now thoroughly washed with a solution of carbolic progress of the case to complete recovery was uninacid 1-20, and the examination proceeded with. The stricture was so very tight that I felt sure the bowel had been cut through, and if any attempt were made to divide the stricture the adhesions would be broken, and fecal extravasation result: yet if left alone with the hope that the obstruction might be spontaneously removed, the gut might be torn at the site of stricture, as happened in the case of Mr. M. Banks6 when, after six days of favorable progress, when the bowel had been left in situ, it ruptured, and in an hour or two the patient was dead. After carefully considering the case I decided to open the abdomen, resect the bowel, wash out the cavity and thus give my patient, as I thought, the best chance for recovery.

The abdomen was opened in the median line, the dead part of the intestine cut off close to the external ring, and the wound again thoroughly washed with the carbolic solution, and thoroughly dusted with iodoform. I then introduced my hand into the

much congested for some inches, while the part be-An assistant held the bowel prevent their escape. The abdominal opening was held together, and it and the exposed bowel were protected with hot towels. I then cut away the injured part of the intestine, being careful to reach healthy tissue, and a triangular piece of the mesentery, the free border of which was allowed to project slightly beyond the resected border of the bowel; vomiting for some hours. As the symptoms were this was done to prevent sloughing of the cut edges of the bowel, an accident which too frequently intercedure until next morning when his parents would feres with the success of the operation. The edges of the mesentery were first brought together with a continuous suture of carbolized silk No. 2. Then the intestine at its mesenteric junction was carefully adjusted and held by fine interrupted silk sutures. The mucous membrane was next sutured and subsequently the serous and muscular coats. For this the Lembert suture was used. The parts were then thoroughly washed and returned into the abdomen, which was afterwards cleansed with hot water. The opening in the groin was again washed, dusted with iodoform, a bone drainage tube introduced, and closed with catgut suture. The toilet of the peritoneum having been made, the abdominal opening was closed with silk sutures, bichloride and iodoform dressings applied, and the patient returned to bed and surrounded by hot bottles.

Reaction was complete in a few hours; and as the terrupted, it will be unnecessary to give it in detail. The highest pulse rate was 120; the highest temperature reached was 100°. The bowels moved spontaneously on the morning of the fifth day, a healthy stool, free from blood, being the result. The only complaint was some colicky pains which gave trouble for some days. He left the hospital six weeks after the operation, and has remained well ever since.

Considerable shock followed the cutting away of the disorganized bowel, and required the hypodermic use of brandy and ether; the pouring of hot water into the belly aided the reaction, although that had already advanced before this was done. Shock, after the cutting away of the dead bowel, is one of the chief dangers of the operation, and unless the patient is in a condition to resist this, it is better to postpone the resection of the dead part until his condition can be improved. I would advise that just before this part of the operation is reached a full hypodermic injection of brandy and morphine, or ether, be given, in order to prevent this shock as much as possible.

Medical Times and Gazette, May 9, 1885.

Another danger-an insurmountable one-is the of the intestine. Of this number eight died and time required for the operation; in most cases two thirteen recovered (one with an artificial anus). hours or more. No. 1.

invariably occurred. The dose of nitrous oxide required to produce insensibility varies very considerably in different persons—a fact which supports the view that nitrous oxide exerts a specific action on the nerve centres. Dr. Buxton also discusses many - Dr. Dudley Buxton has communicated two other interesting points in the action of the gas, valuable papers upon the above subject to the such as the occurrence of hallucinations.-Lancet,

> A New Substance in the Urine.—Dr. Leo's with the polariscope. As sugar now-a-days is exclution, this fact is of enormous value in trade. Scheisearches yield analogous results, though in a different field. He has examined a great quantity of diabetic urine after three different methods, namely, mentation; and with the polarisation apparatus. In many cases the results agreed, while in others there was a considerable difference. He succeeded in isdiffering considerably from grape-sugar, and turning the plane of polarisation to the left. The power of reduction of this newly-discovered substance is to that of grape-sugar as 1:2.48. Dr. Leo found this substance in three specimens, of diabetic urine, but was examined for that purpose. From this, it may be concluded that the substance does not originate product. The theory of Dr. Jaques Meyer, of Carlsbad, that it may be connected with obesity is negatived by the fact that, of the three persons in whom this substance was found, only one was corpu-

CHICAGO, ILLINOIS,

SATURDAY, MAY 7, 1887.

HIGH PULSE-TENSION.

With our increase in knowledge and means of clinical research has been developed a disposition to undervalue the methods and ideas of our forefathers. With the multiplication of instruments for diagnosis, much of the oldtime dependence upon the eye and finger has been lost. This is particularly true with regard the more if they are the subjects of gout or renal to the pulse. Hence it is with satisfaction that we direct attention to the Croonian Lectures delivered last month in London, before the Royal College of ment, Broadbent thinks not, unless it threaten the Physicians, by Dr. William H. Broadbent, upon structural integrity of the heart or brain, in which turing to consider so old a subject on the ground that blood-letting should be resorted to, and would save there has been a great "awakening of interest" in life in hundreds of cases in which it is now sacrificed this direction, and that, although much has been to popular prejudice against venesection. In other learned, there is still a great deal to be acquired. instances tension may be relieved by the administra-The lectures may be found entire in the British Med- tion of appropriate drugs, such as the nitrite comical Journal, of March 26, April 2 and 9, 1887, and pounds and the potassium and lithia salts which the Lancet of the same dates. They are too long for latter, by promoting metabolism and diuresis, oceven a cursory review within the limits allotted to this casion the elimination of those waste products, article. Hence, among the many interesting points whose presence in the blood possibly tends to considered, we shall direct attention to only that of keep up tension by irritating the arterioles and capilhigh tension of the pulse.

By tension is meant the degree of intra-vascular blood pressure; "distension might perhaps be more apparatus in which the arteries are contracted upon expressive than tension, if less exact and technical." their contents, while the blood-pressure is in reality It is shown by fulness of the artery between beats, low, owing to feebleness of the heart's action. This the vessel lying like a cord under the finger. The Broadbent would designate as "virtual tension," and is pulse is compressed with difficulty, is slow in ascent, the characteristic pulse of cardiac dilatation. "Now, long in duration and gradual in its decline, these as the artery allows itself to be flattened, the pulse characteristics being more marked, the larger the ves- wave which lifts it into the cylindrical form appears sel. High arterial tension is chiefly due to peripheral to be sudden, and the pressure after lasting a certain resistance, i.e., hinderance to the outflow from the time, seems to drop suddenly. The artery may be capillaries into the veins. At the same time the small or large, and the pulse varies accordingly.

heart's action must be vigorous. The causes of inlournal of the American Medical Association. creased tension are, according to Broadbent: 1. Hereditary, as shown by the facts that paralysis and heart disease are often found in members of the same family, although of different habits of life, and that functional derangements, due to high pulse-tension, are seen in childhood and throughout life in many families. 2. Kidney disease of all kinds, except such as is attended with suppuration; being most pronounced in contracted kidney. 3. Gout and allied conditions, including aimost the entire range of affections attributed by Murchison to functional derangements of the liver. 4. Lead-poisoning, with or without renal disease or gout. 5. Anæmia. This is not fully understood, nor, as Broadbent says, is it invariably the case. 6. Pregnancy. 7. Constipation. 8. Plethora. 9. Chronic bronchitis and emphysema.

> The effect upon the heart of a gradual increase of arterial tension is to produce hypertrophy of the left ventricle, so commonly seen in renal cirrhosis. When, however, high tension is suddenly brought about, the heart is liable to dilatation. This explains the danger, which threatens individuals past middle age, particularly in violent or too prolonged exertion, mischief.

As to whether high tension always calls for treat-The speaker excused himself for ven-case it should be lessened. If apoplexy be imminent, laries into contraction.

There is another condition of the circulatory

Again, as the heart becomes worn out in Ten, twenty, or thirty drops of chloroform, he says, often encountered in connection with the large white majority of Dr. Sayre's cases young children? kidney. The pulse is weak, soft, of low tension, and there is albuminuria.

als with high blood-pressure.

There are many other points in these Croonian not permit the consideration. A perusal of the lectures in full would repay the busy practitioner, since they not only contain much valuable information, but also abound in practical suggestions. They show Dr. Broadbent to be a man of intelligent obexperience.

WHAT IS THE SAFEST ANÆSTHETIC?

ether or chloroform as an anæsthetic recently took lung and kidney trouble as when ether is used for place before the New York Academy of Medicine, half an hour or an hour. And while anæsthesia of two which may be taken as giving a fair expression of the minutes' duration in a case of renal trouble might opinion of some of the most experienced men in the not be followed by bad effects, it probably would if country in regard to the relative advantages of these the agent were used for half an hour. two agents. tional eases of laryngeal or tracheal stenosis.

repeatedly shown that inhalers should be used. Many surgeons give morphine or atropia, or both, before beginning the anæsthetie; this is a wise preeaution, but does not justify carelessness in giving the anæsthetic. Dr. Thallon uses the ordinary inhaler employed by dentists for nitrous oxide gas when giving ether, and with it he has kept up anæsthesia for hours without using more than a quarter of a pound of ether. All anæsthetics are dangerous, and become more so when administered in unknown quantities and in an unsafe manner

ABORTIVE MEDICATION.

Ithe tineture of iodine, by injections of carbolic acid; There is a wide-spread impression that anyone can another pretends to have obtained the same result give the anæsthetic; and there are many surgeons more quickly by making a deep incision at the very who still adhere to the towel-cone, giving unknown beginning of the malady, but this is followed by a quantities of ether or chloroform, though it has been prolonged application of spirits of camphor, which is known to possess antiseptic properties, and which should be taken into account in the result of the medication. Some surgeons employ multiple punctures at the commencement of diffuse phlegmon, but M. Le Dentu prefers large incisions which, if emploved at the outset of the exudative period, will, according to this surgeon, be capable of arresting the progress of the inflammation, and even of completely preventing suppuration. It is known that the evolution of charbon is marked by two stages: in the of any real use in that malady. It appears however, first the infection is local, in the second it is gener- to have attenuated the malady, by aborting the supalized and irremediable. It is sufficient to intervene purative process. before the second stage to make the malady abort. This may be done by the eradication of the malignant pustule, followed by deep cauterization and by iodine injections into the periphery of the ædematous zone.

By analogy, the same happy results were hoped for in syphilis, tuberculosis, and other affections. But the utility of the extirpation of the chancre is strongly combated, by a great number of authors, and those among the most competent, absolutly deny any efficacy in the operation. The question is then suggested, whether the constitutional treatment of syphilis may be considered as an abortive medication; to this, however, De Beurmann makes no reply. Another question suggested is, whether tuberculosis is a virulent malady, comparable to syphilis, generalized immediately after inoculation? doctrine is not without its partisans, but, as De Beurmann suggests, this is no reason why the abortive medication should be neglected in these cases, as most encouraging results have been obtained by the ablation of a local tuberculous mass, anatomical tuberculosis, lupus, masses of osteitis, cold abscesses, etc. In favor of surgical interference, the author argues that certain masses of tuberculosis, local in appearance, are only manifestations of general infection, while others are truly local affections and consequently curable. In puerperal infection antiseptic injections, which have been so much vaunted in these latter times, have given the most brilliant results. Even rabies, which till now has been considered incurable, may be usefully combated by the abortive medication, now known as the method of Pasteur or the anti-rabic inoculations. Against pneumonia, typhoid fever, no abortive remedy has as yet been found efficacious, notwithstanding the daring attempts that have been made in this direction, particularly as regards pneumonia.

The antiseptic injections even in the body of a pneumonic mass are still too recent to judge of their efficacy or otherwise. Intestinal antisepsis and general antisepsis render very great service in typhoid recommended by Dr. Du Castel against small-pox is ter printed at present. The present status will justify

THE AMERICAN MEDICAL ASSOCIATION AND THE JOURNAL.

As we issue a large extra edition of the present nnmber of The Journal for general circulation to members of the profession in all parts of the country, we have presented all that we could gather at this date of direct interest to members of the Association, concerning the programme of work, both in general session and in the Sections, and the reductions in railroad fares and hotel charges so far authorized. The programme is incomplete, and it is desirable that further reports of papers and contributors should be forwarded to the Chairman of the Committee of Arrangements as early as possible. The indications thus far point to a large meeting, and one of the most important that has been held in many years. The promised liberal reduction in railroad and hotel charges, and the central position of the place of meeting and its easy access from all directions, are favorable for a large gathering of representatives from every section of our country. And they will certainly receive a cordial welcome from the profession and citizens of Chicago.

The Editor of THE JOURNAL and his assistants will be no less happy to welcome the members of the Association to the publication office, where they can more readily realize the progress made during the little less than four years since the first number of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIA-TION was issued. At that date, 1883, and for the preceding five years, the average annual receipts of the Treasurer indicated less than 1,000 members regularly paying the annual membership dues, while since that period the number has increased more than threefold, and with the receipts from subscribers and advertisers, has so increased the income that, instead of \$5,000 as in 1883, it will reach not less than \$20,000, as will be shown in the forthcoming report of the Treasurer for the current year. And instead of indebtedness, as many feared, they can see a profever, but we cannot really say that they have jugu- ductive surplus of printing material in active use exlated the malady. Fortunately the same cannot be ceeding in eash value \$1,058—constituting the nusaid of the salicylate of soda in acute articular rheu- cleus of a printing and publication establishment matism, and of sulphate of quinine in paludal infectivities, at the end of another decade of judicious busition, which are two precious medicaments, and really ness management, will equal a working capital of abortive. It has been asked whether the medica- \$10,000, and then doing the work of a weekly journal tion by ether and opium in combination, recently of nearly double the number of pages of reading-matthe commencement of the next volume. But it been: should not be forgotten that all true progress must be in the line of natural growth or well-proportioned development.

Illinois State Medical Society.—The annual meeting of this important State organization is to commence in this city on Tuesday, May 17. It is operation, before the patient is exhausted and the highly important that there should be a full attendance from all parts of the State. Neither the local Committee of Arrangements nor the profession nephrectomies have died of shock, yet of 24 nethroughout the State should allow the fact that the American Medical Association is to have its annual meeting in the same city only three weeks later, to lessen their interest in, and attention to the professional organization of their own State. The legitimate basis of all efficient general organization of the hip joint disease, and (especially) cystitis, for a long profession consists of the local City, County and District Societies embracing the general practitioner and specialist alike. Representatives from these make the State Societies; and on the efficiency of the several State organizations will always depend the character, scientific value, and permanency of the National Association.

Swiss Delegates to the Congress.—We learn with pleasure that the Swiss Confederation have appointed Professor Theodor Rocher, of Berne, Switzerland, and Dr. Henry A. Banga, resident in Chicago, U. S. A., as delegates to the International Medical Congress, to be held in Washington, Sept. 5, 1887.

THE WEST VIRGINIA STATE MEDICAL SOCIETY, will hold its twentieth annual session at White Sulphur Springs, W. Va., July 13, 14 and 15, 1887. The Secretary is J. L. Fullerton, M.D., of Charleston, W. Va.

SOCIETY PROCEEDINGS.

CHICAGO MEDICAL SOCIETY.

Stated Meeting, March 21, 1887.

(Concluded from page 470.)

Dr. William T. Belfield read a paper on

DIGITAL EXPLORATION OF THE KIDNEY, WITH REPORT OF THREE CASES.

the addition of four more pages of reading matter at of the operation. The chief causes of death have

- 1. Shock (42 per cent. of the fatal cases).
- 2. Uraemia (14 per cent.).
- 3. Peritonitis (21 per cent.).

These three factors were thus responsible for 77 per cent. of all deaths. Improvement in the results of renal surgery seems, therefore, to require means for the avoidance of these three great dangers.

The chances of fatal shock are decreased by early damage to kidney tissue extensive through long illness. This self-evident proposition is illustrated by the fact that, while about 18 per cent. of all (250) phrectomies of fairly healthy kidneys removed for wounds of loin, ureter, for mobility, etc., not a single death occurred from shock.

The greatest obstacle to the early surgical treatment of renal diseases has been faulty diagnosis. Such cases are usually treated as lumbago, sciatica, time before the true seat of the lesion is detected or even suspected. Since it is not always remembered that pyelitis produces symptoms identical with those commonly ascribed to cystitis, the former is not suspected, and a diagnosis of cystitis is made; and as cystitis is still too generally regarded as an entity, a disease instead of a mere symptom requiring explanation—the patient is treated for "chronic cystitis." Finally, months or years later, a lumbar swelling or other symptom reveals the renal origin of the difficulty. Meanwhile the patient has become so enfeebled that he succumbs to the shock of an operation that could have been safely borne at an earlier period. Early exploration of the kidney—a comparatively slight operation—has, by drainage of the pelvis, in many cases relieved a difficulty which at a later stage would have required nephrectomy, a formidable operation; moreover, a preliminary drainage has been shown to be a valuable factor in diminishing mortality from nephrectomy. Thus, of seventy-three nephrectomies for suppurative lesions collected by Gross, twelve were made after previous exploration of the kidney, with but one death; of the remaining sixty one—without previous nephrotomy—thirty-one died.

Uraemia rarely occurs after any renal operation provided the second kidney be present and in healthy condition. While commonly associated with nephrectomy, one of the annexed cases shows that unemia may be inevitable after simple nephrotomy; hence a necessary preliminary to any renal operation should be an attempt to ascertain the functional condition of the opposite kidney. In the female this can often be accomplished by cauterizing the ureter, after Paw-THE PRESIDENT, E. J. DOERING, M.D., IN THE CHAIR. lik's method; in the male probably the best, though still an uncertain, means is Silbermann's instrument for compressing one urereter. (Instrument shown.) The statement that the abdominal incision, by permitting digital examination of the opposite kidney, obviates the dangers of uræmia, is fallacious; for in Of some 250 cases of nephrectomy heretofore remany cases kidneys which are indistinguishable by ported, about 44 per cent. have died from the effects; the finger, or even by the eye, from normal organs

are extensively invaded by disease—inflammatory, urinate. Six months ago he passed two small calculi tuberculous or calculous. hibited by Dr. Steele this evening are signal examples has had slight colic on left side several times, followed —normal in size, contour and consistence, yet each by expulsion of clumps of pus but no calculi. extensively tuberculous. Palpation through an abdominal incision could have detected nothing abnor- ably former, bacilli were found in one examination of mal in either of these kidneys.

The following cases illustrate several of the prin-

ciples above enunciated:

hood; has had dyspepsia for years; for a year past ney showed the pelvis considerably dilated, its orihas suffered from headache, pain in back and left thigh; menstrual intervals shortened to two or three mucous membrane ulcerated in several places; the weeks. Was variously treated for lumbago, sciatica, and ovarian disease. In March, 1886, urination was unduly frequent and sometimes painful; urine contained pus and blood; was treated for cystitis.

On admission is emaciated and feeble; urination every half-hour or oftener, painful; has frequent pain in lumbar region, often shooting down to left thigh; requires morphine constantly. Urine acid, depositing blood, pus, and occasional rosettes of large uric had never caused pain, had been first diseased; the

acid crystals.

Diagnosis, calculous pyelitis, probably limited to left side; right ureter catheterized and urine appeared

normal.

November 29, 1886, kidney was exposed and pelvis explored; mucous membrane rough and ulcerated, \(\) clots of pus evacuated; wound in kidney packed with bladder.

Except for persistent vomiting for a few day, recovery was without notable incident. The renal fistula was closed on the twenty-first day; patient has since been free from all her former symptoms often affords the only available means for accurate

and is regaining flesh and strength.

G. F., 30 years old, was knocked down by a cable car November 28, receiving a lacerated wound of tion is almost devoid of danger; while saving the right hand and various contusions. The hand was kidney, it may accomplish all that a dangerous nedressed, and patient presented no notable symptoms phrectomy could offer at a later stage; and if it fails to until December 11, when often straining at stool lie cure, it materially increases the chances of recovery passed a large quantity of blood with the urine and from a subsequent nephrectomy. had severe pain and tenderness over the right kidney, with some temperature; these symptoms persisted in of the opposite kidney should precede an exploratory spite of rest, ergot, gallic acid and opium; the right incision into the pelvis. loin while not swollen, felt boggy. December 22, the patient having experienced several irregular chills and sweats during the previous day, a lumbar incision was made down to the right kidney. The peri-renal tissues were found closely adherent, extravasated blood was seen under the capsule and a rent one and a quarter inches long was found in the posterior surface of the kidney extending into the pelvis; about half an ounce of a watery fluid lay behind the kidney. A large drainage tube was inserted. The temperature remained high for several days, after which entitled recovery rapidly ensued, and January 14 the patient was discharged well; the wound entirely healed.

C. L., 48 years old, farmer, began some two and a half years ago to suffer from slight pain and stiffness in the loins; later, pus appeared in the urine; was treated for Bright's disease. ago urination became frequent and sometimes painful; was supposed to have cystitis. Has lost flesh; his rest has been much disturbed by frequent ealls to sity into milliampères.

pus, and the lower organs were normal.

Exploration, January 26. The kidney (left) was considerably enlarged; no calculus could be de-S. M., widow, 26 years old, delicate since child- tected with finger or needle. Incision through kidfice narrowed by a thickening of upper part of ureter;

pyelitis evidently tuberculous. Nothing of note occurred until the fifth day, when the urine became scanty and tinged with blood; soon the usual evidences of uræmia became manifest, and death ensued from this cause on the eleventh day. A partial autopsy showed that the right kidney was extensively, the left slightly tuberculous; bladder and prostate normal. Evidently the right kidney, which function of the left, which had latterly been performing most of the renal excretion, had been arrested not by the slight incision, but by the congestion which followed the removal of the accustomed pressure in the dilated pelvis. Similarly uræmia has followed the sudden evacuation of a habitually distended

THE PRESIDENT, H. M. FIELD, M.D., IN THE CHAIR.

11. J. Harriman, M.D., Secretary.

A paper contributed by Dr. Apostoli, of Paris,

"ON A NEW METHOD OF TREATMENT OF CHRONIC METRITIS, AND ESPECIALLY ENDO METRITIS,

> BY THE INTRA UTERINE CHEMICAL GALVANO CAUSTIC,"

About a year | To be successful in this operation the following electrical instruments are necessary:

First.—A medical galvanometer divided for inten-

last for some time and to preserve practically the by simple electrolysis or by galvanic cautery; if by same strength after several successive operations, electrolysis it was nothing new, as Dr. Cutter has The best battery is that of Leclanché.

length to reach all parts of the uterine cavity and curately controlled, and thus its action was uncertain. which is not affected by acids, as platinum. It must also be provided with a must to protect the vagina, that the action was simply an electrolytic one. He the best being a celluloid tube.

applied to the abdomen, allows a very intense current to pass without pain, without heat and without fear of burns; the best is the one invented by Dr. Apostoli in 1882.

resisting enough not be easily broken.

The details of the operation are as follows:

1. Make a tepid and antiseptic vaginal injection, placing the patient as if for an examination by the speculum.

2. Charge the battery, arrange the galvanometer and put in proper position the clay muff.

progressively the electrode previously singed and disinfected.

positively in all hæmorrhagic cases and less thor-

oughly in other cases.

Never surprise the uterus or make a too painful. application, for it should be remembered that there are irritable uteri which can receive treatment only in a very mild form. After two or three applications the intensity must be increased, reaching in most cases 100 to 150 milliampères and in some cases to 200 milliampères. The intensity must at first be proportioned and regulated according to the patient's power of endurance; afterward according to the extent and gravity of the lesion and the time it has existed. The duration of the application should vary from five to ten minutes. Applications should be made every week and every second day if required. A rest of bifid. The patient had never menstruated, but last several hours should be required of all patients who have been operated upon. This rest is necessary for the safety as well as for the efficacy of the method. Vaginal antiseptic injections night and morning should be ordered. This simple and harmless treatment is only a galvano-chemical scraping, acid or basic, according to cases. It induces a formation of new mucous membrane and forms a kind of intrauterine exudation, the action of which can be varied at will. Its beneficial effects, which Dr. Apostoli has verified in a great number of instances, does not fail to make itself felt from the first, increasing rapidly and soon restoring the patient to health. It does not condemn the woman to a forced repose and calls for no additional treatment.

Dr. E. W. Cushing did not see any advantage in the method described by the paper over the usual practice of giving ether and curetting the interior of the uterus under antiseptic precautions. He certainly regarded the latter as the shorter and safer method, inasmuch as he understood that Dr. Apostoli's procedure required, in some cases, as many as 90 or 100 applications. He did not understand from

WARNER understood from the paper thought that it would be a dangerous method of pro-Fourth.—A neutral or insensible electrode, which cedure in the hands of the inexperienced or careless as the degree of effect could not be accurately known. The effect of the application might go so deep as to injure the deeper tissues of the uterus and thus set up an inflammation, or it might not reach deeply Fifth.—Cords supple enough not to obstruct and enough to remove all the diseased tissue. Unless it has the same effect as curetting it will fail to accomplish its purpose.

OVARIAN TUMOR ATTACHED TO VERTEBRA-BIFID

Dr. E. C. Keller presented a tumor with the following history: Patient 19 years old. Was sent 3. Introduce into the uterine cavity slowly and to New England Hospital two months ago and was supposed to be pregnant. She stoutly denied the possibility of such a condition. Upon examination 4. Cauterize the unterine cavity thoroughly and fluid was found in the abdominal cavity and external ballottement gave evidence of a solid tumor. The ascites increased to such an extent as to make relief of some kind necessary. The trocar was introduced twice but no fluid was withdrawn. Subsequent developments showed that the trocar struck the solid tumor both times, and thus prevented the exit of the fluid. The abdomen was then aspirated and four quarts of fluid removed; the remainder of the fluid leaking out after the aspiration. Peritonitis followed the tapping and the radical operation was postponed three weeks. Upon opening the abdomen a solid tumor was found attached to the fourth lumbar ver-This tumor had arisen from the left ovary but was attached to the right side. The uterus was May had molimen. Good recovery.

DOMESTIC CORRESPONDENCE

GALVANIC MEASURE.

Dear Sir:—You have kindly opened your valued pages to me, which I deemed necessary to protect American Electro-therapy from ridicule. called attention to the error, and that ends the matter as far as I am concerned, but I beg again for space, not to answer the personal attack made upon me, as that is neither of interest or importance, but Washington, D. C., in 1887. to add another word to the subject of galvanic measure, that your readers may understand why I have spoken so positively.

In this progressive age it may seem bold to the superficial observer to say, "that no one ever has used, or ever will use a certain remedy without danger," but the electric current is a force so well known in certain respects, and so exactly measurable, that we can draw the line with assurance; and I am no more a prophet in saying that ten ampères of current can never be used upon the living subject than were I to say that you cannot explode a dynamite cartridge upon the abdomen without serious injury to the subject. About the same effect would be produced by ten ampéres of current. Ten ampères is of the Congress. the current used in the large electric lamps upon our streets; for the inside store or hotel light six ampères are generally employed. If an unfortunate fireman comes in contact with such a current for a moment, in cutting the wire, he is struck dead! The fatal shock is caused by about one-tenth of an ampère, by 100 milliampères, through the high resistance of through the human body, which, with a dry skin, a day. represents a resistance of 30,000 ohms roughly estimated, one-tenth of an ampère (100 milliampères), the meeting places of the Congress and its Sections. strange as it may seem, would be the actual current passing through and causing the fatal stroke!

ten ampères of current passed through the abdomen? Granting a deep uterus and thin abdominal walls, the JOURNAL in due time. tissues intervening between the electrodes ofter a resistance of about sixty ohms, and ten ampères through sixty ohms of resistance represent a force equal to six horse power! If the resistance is greater, eighty or 100 ohms, as it is likely to be, this current would mean eight or ten horse power. What what would become of an abdomen subject to this energy for five months? Six horse power represents in electro-chemical force a cautery which would burn the tissues like hot iron whatever electrodes might be used; and it is not likely that this, or any approximate intensity ever has been or ever will be serviceable or possible in the healing art. Any scientific electrician will verify these statements.

Very truly yours,

Geo. J. Engelmann, M.D. 3003 Locust St., St. Louis, April 26, 1887.

INTERNATIONAL CONGRESS.

NINTH INTERNATIONAL MEDICAL CONGRESS, WASHINGTON, D. C., SEPT. 5, 1887.

COMMITTEE OF ARRANGEMENTS.

The following memorandum is published by order of the local Committee of Arrangements for the information of persons desiring to attend the Ninth Meeting of the International Medical Congress, in

RATES OF TRANSPORTATION.

Red Star Line, \$100; Antwerp to New York and

Inman Line, \$100; Liverpool to New York and

Hamburg Line, \$90; Hamburg to New York and

Royal Netherlands, \$80; Amsterdam to New York and return.

North German Lloyd Line, \$187.50; Bremen to New York and return.

Same rates are allowed for the families of members. Cunard Line, 10 per cent. reduction for members

HOTEL RATES IN WASHINGTON.

Arlington Hotel, from \$3.00 to \$3.50 per day. Riggs House, from \$3.00 to \$3.50 per day. Willard's Hotel, from \$3.00 to \$3.50 per day. Metropolitan Hotel, \$3.00 per day. National Hotel, \$3.00 per day.

Other hotels conducted on European style will the human body. The current used for the Brush furnish rooms at \$1.00 to \$2.00 a day. Good Lodgelectric light is about ten ampères; if this is sent ing-houses will also furnish rooms from \$1.00 to \$1.50

Proper accommodations have been secured for

Transportation within the limits of the United States has not yet been determined upon, but will Such is the effect of 100 milliampères through soon be made public. Particulars of the plan of 30,000 ohms resistance; what would be the effect if entertainments will be published in the official programme, and all notices will be published in THE

> Official: A. Y. P. Garnett, Chairman.

C. H. A. Kleinschmidt, Secretary.

Since the above announcement of the Committee we are informed by Dr. J. W. H. Lovejoy, Chairman of the Sub-Committee on Transportation, that the Cunard Line of Steamships have agreed to include the families of members of the Congress, in the reduction of 10 per cent. from their usual rates for the round trip.

Although the regular agents of the White Star Line of Steamships from Liverpool to New York, when applied to by the proper Committee at Washington, refused to make any reduction, as has been heretofore announced, we are reliably informed by Dr. James 11. Parkinson, of Sacramento, Cal., that the proprietors of that line have since advertised a reduction of 10 per cent. from the usual rates, to members of the Congress and their families on the return trip from New York.

ASSOCIATION ITEMS.

AMERICAN MEDICAL ASSOCIATION.

The Thirty-eighth Annual Session will be held in Chicago, Ill., commencing on Tuesday, June 7, at II A.M., in Central Music Hall, corner of State and Randolph streets, and will continue four days. Good rooms for the several Sections will be provided as near the hall for general meetings as possible. Registration books will be open in Central Music Hall on Monday, the day preceding the meeting, for those who wish to register early. In the general meetings of each morning, in addition to the Address of the President of the Association and the Addresses of the Chairmen of the several Sections, the following important subjects will be presented for consideration:

(a) Annual Report of the Board of Trustees for the publication of The Journal, J. M. Toner, M.D.,

Washington, Chairman.

(b) Report of the Special Committee on Changes in the Plan of Organization and By-Laws of the Association, N. S. Davis, M.D., Chicago, Chairman.

- (c) Report of the Committee on a Monument to Benjamin Rush, A. L. Gihon, M.D., U. S. N., Chair-
- (d) Report of the Special Committee on Cremation, J. M. Keller, M.D., Hot Springs, Ark., Chairman.
- (e) Report of the Standing Committee on Meteorological Conditions and their Relations to the Prevalence of Disease; also concerning the Collective Investigation of Disease in Cooperation with the Committee of the British Medical Association, N. S. Davis, M.D., Chicago, Chairman.

(f) An Amendment to Create a "Section on Dermatology and Venereal Diseases, Proposed by Albert

L. Gihon, M.D., U.S. N.

The work for the several Sections is not yet completed, but as far as reported is as follows:

- Section of Practical Medicine, Materia Medica and Physiology.
- C. N. Cooper, Cleveland, Tenn., "Glanders in the Human Subject, with a Case."

N. S. Davis, Jr., Chicago, Ill., "Value of Antipy-

rin in the Treatment of Rheumatism."

G. W. McCaskey, Fort Wayne, Ind., "A New Method of Intra-Pulmonary Medication," etc.

Chairman, J. S. Lynch, M.D., Baltimore, Md.; Secretary, J. B. Marvin, M.D., Louisville, Ky.

TWe have received no report from the officers of this Section.]

- Section of Obstetrics and Diseases of Women.
- J. E. Kelly, New York, N. Y., on "Lithiasis in Pregnancy.

Charles Meigs Wilson, Philadelphia, Pa., "The

Technique of Ovariotomy."

Hiram Corson, Plymouth Meeting, Pa.,

Treatment of Abortion."

Wm. T. Taylor, Philadelphia, Pa., "Eclampsia." J. W. Robertson, Cal., "The Medical C. W. S. Caldwell, Freeport, Ill., "Intra-Uterine and Hydrology of Northern California." Therapeutics."

George F. French, Minneapolis, Minn., "The Chief Source of Danger from the Use of the Intra-Uterine Sound."

B. E. Hadra, Austin, Texas, "Hysteria and the Ovaries.

Ely Van de Warker, Syracuse, N. Y., "Laparotomy as a Cure for Tuberculosis of the Peritoneum."

John A. Miller, San Francisco, Cal., "Erosions in Ulcerations of the Vaginal Portion and their Relation to Lacerations of the Cervix, with Practical Hints when not to Perform Emmet's Operation."

John Morris, Baltimore, Md., "Treatment of Pla-

centa Prævia.

Win. M. Findley, Altoona, Pa., "Ante-Partum

Hæmorrhage."

Papers have also been promised, more or less definitely, by H. F. Campbell, Augusta, Ga.; L. Ch. Boislinière, St. Louis, Mo.; S. S. Todd, Kansas City, Mo.; E. H. Trenholme, Montreal, Canada; W. M. McPheeters, St. Louis, Mo.; A. McLaren, St. Paul, Minn.; John M. Keating, Philadelphia, Pa.; W. H. Wathen, Louisville, Ky.; W. H. H. Githens, Philadelphia, Pa.; Howard A. Kelly, Philadelphia, Pa.; W. P. Manton, Detroit, Mich.; and A. H. Halberstadt, Pottsville, Pa.

Chairman, F. M. Johnson, M.D., Kansas City, Mo.; Secretary, W. W. Jaggard, M.D., Chicago, Ill.

III. Section of Surgery and Anatomy.

H. O. Walker, Detroit, Mich., "External Perineal Urethrotomy, with Report of Eighteen Cases, Instruments, etc."

N. B. Carson, St. Louis, Mo., "Injuries of the

Abdomen and their Proper Treatment.

W. C. Wile, Philadelphia, Pa., "Surgical Notes from the Case-Book of a General Practitioner.'

I. D. Griffith, Kansas City, Mo. "Skin Grafting." W. D. Kearns, Pittsburgh, Pa., "Retro-tlexed

Splints for Fractures of the Forearm."

E. E. Glover, Terre Haute, Ind., "Operative Treatment of Non-Malignant Stricture of the Rectum."

V. P. Gibney, New York, N. Y., "The Management of Cold Abscesses.

R. Harvey Reed, Mansfield, O., "A Case of Calculi in the Appendix Vermiformis."

A. Sidney Roberts, Philadelphia, Pa., "The Mechanical and Operative Treatment of Infantile Spinal and Cerebral Paralyses.

Papers have been promised by Wm. T. Bull, New York. N. Y.; H. Tuholsky, St. Louis, Mo.; and J. McF. Gaston, Atlanta, Ga.

Chairman, H. H. Mudd, M.D., St. Louis, Mo.; Secretary, A. M. Pollock, M.D., Pittsburgh, Pa.

IV. Section on State Medicine.

The following gentlemen have promised to read papers upon the subjects mentioned:

Henry B. Baker. Lansing, Mich., "Scientific Col-

lective Investigation of Disease.'

Carl H. Horsch, N. H., "The Necessity of Inspection of Food Animals.

J. W. Robertson, Cal., "The Medical Climatology

Prof. V. C. Vaughan, University of Michigan,

"The Chemistry and Physiological Action of Tyro toxicon."

T. B. Greenley, Ky., "The Hygiene of Infancy and Childhood.

and Necessity of the Regulation of Medical Practice by the State.'

H. C. Markham, Independence, Iowa, "State Secretary, W. B. Lawrence, Batesville, Ark. Regulation of Medical Practice-Its Value and Im-

portance.

Major Morse K. Taylor, Surgeon U. S. Army, "The Influence of Military Life on the Health of the Soldier.'

Woods Hutchinson, Iowa, "The Physical Basis of Brain-Work."

Walter Wyman, Surgeon U.S. Marine Hospital Service, and several others, have promised papers, but

have not yet announced their titles.

The Section is also instructed to submit at the coming meeting of the Association the draft of a law regulating the conditions requisite as preliminary to the study of medicine, the requirements for graduation and for the license to practice medicine, to be urged upon the several States in order to secure uniformity in method and results throughout the United States. It is proposed to discuss this question in connection with the papers of Drs. Millard and Markham above announced. Members of the Association desiring to read papers upon any subject properly coming within the purview of the Section on State Medicine, are requested to notify the Chairman or Secretary at once.

Chairman, George H. Rohé, 611 N. Calvert St., Baltimore, Md.; Secretary, Walter Wyman, U. S. Marine Hospital Service, New York, N. Y.

V. Section of Ophthalmology and Otology.

C. M. Hobby, Iowa City, Iowa, "Sympathetic Ophthalmia."

J. L. Thompson, Indianapolis, Ind., "Observations on Displacement of the Crystalline Lens, from Congenital and other Causes."

J. M. Ray, Louisville, Ky., "Hydrobromate of

Hyoscine as a Mydriatic."

F. C. Hotz, Chicago, Ill., "Treatment of Hypopyon Keratitis with Frequent Irrigations of Sublimate."

J. W. Heustis, Pittsburgh, Pa., "Some of the

Ophthalmological Clinics of Europe."

Robert Tilley, Chicago, Ill., will exhibit "A Boy of 12 years illustrating the results of either Pemphigus or Essential Shrinking of the Conjunctiva in both Eyes.

Dudley S. Reynolds, Louisville, Ky., "Nature and

Treatment of Phlyetenular Ophthalmia."

Chairman, X. C. Scott, M.D., Cleveland, Ohio.; Secretary, J. H. Thompson, M.D., Kansas City, Mo.

and Hypodermic Medication of Infants."

I. N. Love, St. Louis, Mo., "Scarlet Fever."

S. B. Sperry, Delafield, Wis., "Aphasia in Children."

of treating Congenital Phymosis."

II. Landis Getz, Marshalltown, Iowa, "Diphtheria."

The following have promised papers: Dunham. Columbus, Ohio; W. D. Haggard, Nash-P. H. Millard, Stillwater, Minn., "The Propriety ville, Tenn.; Henry Jameson, Indinapolis, Ind.; J. V. Shoemaker, Philadelphia, Pa.

Chairman, J. S. Knox, 70 Monroe St., Chicago, Ill.;

VII. Section of Dental and Oral Surgery. K. B. Davis, "Pathological Conditions of the

Teeth, and their Systemic Effects."

G. Frank Lydston, "The Necessity of Liberal Professional Education in the Practice of Dental and Oral Surgery."

Garrett Newkirk, "The Deciduous Teeth and their Relation to the Health of Children."

A. H. Thompson, "Pathological Heredity, and

Congenital Abnormalities of the Teeth."

Arthur Freeman, "Dental Lesions causing Facial Neuralgia and other Neural Phenomena."

W. H. Atkinson, "Sponge Grafting."

Subjects not announced, Chas. Payne, A. E. Baldwin, J. Taft, W. W. Allport, John Marshall.

Chairman, J. S. Marshall, 240 Wabash Ave., Chicago; Secretary, Eugene S. Talbot, 125 State St., Chicago.

VIII. Section of Medical Jurisprudence.

Judge Amos G. Hull, New York, "Medical Jurisprudence in its Relations to Undue Influences as Affecting Wills and Contracts."

Joseph F. Edwards, Philadelphia, Pa., "The Suppression of the Illegal Practice of Medicine."

James G. Kiernan, Chicago, Ill., two papers, "State Supervision of the Insane," and "Medico-Legal Relations of Epilepsy."

N. S. Davis, Chicago, Ill., "The Medico-Legal Relations of Alcoholic Liquors, Fermented and Dis-

tilled."

Frank S. Billings, Lincoln, Neb., "The Necessity of a Uniform Stantlard of Education; especially more detailed Pathological Instruction to Unity of Professional Action in Forensic Medicine."

T. D. Crothers, Hartford, Ct., "Mental Respon-

sibility in Inebriety."

S. V. Clevenger, Chicago, Ill., "The Medical Jurisprudence of Mental and Nervous Diseases."

E. C. Spitzka, New York, "Paralytic Conditions

in Relation to Testamentary Capacity."

N. E. Brill, New York, "Report on the present state of our knowledge concerning Concussion from Railway Accidents."

Alfred F. Holt, Cambridge, Mass.; W. C. Wile, of Philadelphia, Pa.; F. E. Daniels, Austin, Texas; and Herman J. Boldt, New York, have also partially promised comments.

VI. Section on Diseases of Children. Chairman, l. N. Quimby, Jersey, City, N. J.;
1. A. Larrabee, Somerville, Ky, "Epidermic Secretary, W. W. Kimball, Minneapolis, Minn.

The above incomplete report of work for the several Sections, includes many interesting and important subjects for discussion, and indicates a very general interest in the coming annual meeting of the W. S. Stuart, Philadelphia, Pa., "New Method Association. We shall add other names and topics each week as they may be furnished us.]

RAILWAY RATES.

The following named roads will give reduced fares to all delegates, members, and their families attending the meeting. Return tickets will be issued on the certificate plan only. Tickets for the return journey will be sold at 1/3 the highest regular limited fare. If there is no limited fare to a desired point, the price will be 13 the unlumited fare. Tickets for the return journey will be limited to continuous passage by first train after they are bought. All tickets for return journey must be accompanied by a certificate signed by the Chairman of the Committee on Transportation, or by an authorized member of the Committee, showing that the holder has attended the meeting. Tickets are good for 10 days from date of purchase.

The roads which will accept return tickets on the certificate

plan are:

Baltimore & Ohio (west of the Ohio River).

Buffalo, New Vork and Philadelphia.

Chicago & Grand Trunk.

Cincinnati, New Orleans & Texas Pacific.

Chicago, Vincennes & Cairo Line.

Chicago & West Michigan. Chicago, St. Louis & Pittsburgh.

Rock Island & Peoria Railway.

Sioux City & Pacific Railroad.

Wabash Western Railway. Wisconsin Central Lines.

[Other roads will be added as heard from. These lists have been prepared at great expenditure of time by the Chairman of the Committee on Transportation,

DR. LISTON H. MONTGOMERY,

Briggs House, 189 Randolph St., Chicago, who should be addressed for additional information.]

HOTEL RATES.

The following hotels in Chicago will commute their rates to delegates and members and their families attending the annual meeting in June:

Grand Pacific Hotel.—A discount of 50 cents to each person per day in all rooms, except those at \$3.00 per day, on which there will be no discount. By this arrangement a \$3.50 room with bath may be had for \$3.00, a \$4.00 room for \$3.50 for each person, and so on. A club room will also be placed free at the disposal of the Association for headquarters, if desired.

The Sherman House will give 50 cents per capita off regular rates, which are \$3.50 to \$5.00 per diem, as well 50 cents per capita off \$3.00 per day rooms where more than one person occupy a room. Such committee rooms, etc., as may be required will be placed at the disposal of the Association free of cost. No cots are ever used at this hotel, and every one will be given a good bed.

The Tremont House offers 50 cents discount from

regular rates, which are from \$3.00 to \$4.50 per diem. This rate applies to each person or delegate, of Willimantic, E. H. Davis, of Plainfield. both included.

The Palmer House gives a rebate of 50 cents per ielsonville. capita or, the American plan, when two occupy a room. On \$1.00 rooms, (European plan) a rebate of 25 cents per capita where two occupy a room. On brook, of Thompson, R. Robinson of Danielsonrooms for which the rate is \$1.50 and upwards, a rebate (on the European plan) of 50 cents per capita is offered.

The Briggs House.—The rates will be \$2.00 to \$2.50 per day for their best rooms, meals included, a reduction of 50 cents per day on transient rates.

McCoy's New European Hotel.—The rate will be 75 cents per day for each person when two or four oc-\$1.00 per day, or for man and wife \$1.50 per day.

Clifton House.—Transient rates are \$2.50 to \$3.50 per day. A reduction of 50 cents per day from the above rates is offered to delegates and their families.

Commercial Hotel. — Transient rates \$2.00 to \$2.50 per day. For all visitors in attendance at this meeting who stop at this hotel, a discount of 15 per cent. will be allowed on all board and room bills.

Leland Hotel offers accommodations to delegates at \$3.00 and \$3.50 per day, i. e. rooms with board.

The Richelieu, on the European plan only. The rate for single rooms, is from \$2.00 to \$5.00 per day; suites of rooms proportionately.

All these hotels are within five to eight minutes' walk from Central Music Hall, corner State and Randolph streets.

CHARLES GILMAN SMITH, M.D., Chairman Local Committee of Arrangements. LISTON H. MONTGOMERY, M.D., Chairman Committee on Transportation.

RUSH MONUMENT COMMITTEE.—The Rush Monument Committee will meet at Chicago, Illinois, on June 7. proximo. The hour and place of meeting will be announced on the morning of the first day of the meeting of the American Medical Association. Chairmen of local Committees are requested to send their reports of collections to the Treasurer, Dr. J. M. Toner, 615 Louisiana Ave., Washington, D.C., First Lieut, and Asst. Surgeon Julian M. Cabell (recently apat their earliest opportunity. It is desirable that every State, Territory, and branch of the Government Services represented should make as favorable a showing as possible in the next report of the Com-George H. Roné, Secretary. mittee.

MISCELLANEOUS.

WINDHAM COUNTY (Conn.) MEDICAL SOCIETY. —At the recent regular annual meeting of this Society the following officers and delegates were elected:

President—Charles J. Fox, of Willimantic. Vice-President—F. G. Sawtelle, of Pomfret. Secretary and Treasurer-Charles N. Allen, of Moosup.

Censors—W. A. Lewis, of Moosup, T. M. Hills,

County Medical Reporter—R. Robinson, of Dan-

Fellows to State Medical Society at Hartford in May-T. R. Parker, of Willimantic, Lowell Holville, W. A. Lewis, of Moosup, H. L. Hammond, of Dayville; alternates, F. O. Bennett, of Willimantic, E. E. Gaylord, of Woodstock, N. Hibbard, of Danielsonville, E. H. Davis, of Plainfield, E. D. Kimball, of Scotland.

Nominating Committee—L. Holbrook; alternate, W. A. Lewis.

Delegates to American Medical Association at cupy a room. A single room for one person is Chicago in June-E. A. Hill, of Killingly, T. M. Hills, of Willimantic, F. G. Sawtelle, of Pomfret.

Essayist for 1888-W. W. Foster, of Putnam; alternate, O. B. Griggs, of Willimantic.

The next annual meeting will be held at the Hooker house in Willimantic.

DEPUTY INSPECTOR-GENERAL LLOYD, R. N., of the office of the Director-General of the Medical Department at the Admiralty, has been appointed to represent the British Naval Service at the forthcoming International Medical Congress.

OFFICIAL LIST OF CHANGES IN THE STATIONS AND DUTIES OF OFFICERS SERVING IN THE MEDICAL DEPARTMENT, U. S. ARMY, FROM APRIL 23, 1887, TO APRIL 29, 1887

Lt.-Col. and Asst. Surgeon J. R. Smith, detailed as member of board to meet in Washington, D. C., April 28, to prepare rules and regulations for the government of the Hospital Corps of the Army. By par. 8, S. O. 92, A. G. O., April 21, 1887.

Major and Surgeon Morse K. Taylor, relieved from duty at Ft. Sill, I. T., May 10, 1887, to proceed home, San Antonio, Texas, preparatory to retirement. Par. 20, S. O. 92, A. G. O., April 21, 1887

Major and Surgeon Chas. M. Heizmann, detailed as member of board to meet in Washington, D. C., April 28. to prepare rules and regulations for the government of the Hospital Corps of the Army. By par. 8, S. O. 92, A. G. O., April 21, 1887.

Capt. and Asst. Surgeon Fred. C. Ainsworth, detailed as member of board to meet in Washington, D. C., April 28, to prepare rules and regulations for the government of the Hospital Corps of the Army. By par. S, S. O. 92, A. G. O., April 21, 1887

pointed), to proceed to Ft. Omaha, Neb., and report in person to the commanding officer of that post for temporary

duty. Par. 19, S. O o2, A. G. O., April 21, 1887.
First Lieut, Chas. E. Woodruff, Asst. Surgeon (recently appointed), ordered for duty at Ft. Wayne, Mich. S. O. 96, A. G. O., April 26, 1887.

OFFICIAL LIST OF CHANGES IN THE MEDICAL CORPS OF THE U.S. NAVY, DURING THE WEEK ENDING APRIL 30, 1887

Atlee, E. W., Asst. Surgeon, ordered to the receiving ship "Vermont."

Biddle, Clement, P. A. Surgeon, detached from the Naval Academy, and ordered to Marine Rendezvous, Philadelphia,

Ashbridge, Richard, P. A. Surgeon, ordered to the Naval Academy.

Hudson, A., Medical Inspector, ordered to the U. S. Str. "Trenton."

Decker, J. Corbin, Asst. Surgeon, detached from the receiving ship "St. Louis," and ordered to the U. S. Str. "Trenton." Hibbett, C. T., P. A. Surgeon, ordered to the U. S. Str. "Trenton."

ournal of the ${ m A}$ merican ${ m M}$ edical ${ m A}$ ssociation.

ABSTRACT LECTURE OF

ANTIPYRESIS AND ANTIPYRETIC METHODS.1

BY PROF. DR. H. VON ZIEMSSEN, DIRECTOR OF THE MEDICAL CLINIC IN MUNICH,

mortality of typhoid (Port).

their supporters, and all parties assert the correctness has shown, by using the same material as did Port, of their views on grounds that, in their opinion, will that Port's hypothesis is untenable. We must wait stand any test. It would be a lamentable state of for other material before further estimating Port's affairs if in this way physicians should become scep- conclusions. tical; and especially if, after a period of active antiresis were divided and made but little impression.

tious diseases, and especially of typhoid fever, a favor-the windows opened day and night. The result of able influence on the individual case? Has it the same this experiment speaks clearly enough: the number or a corresponding influence on the totality of cases of deaths from typhoid fever by this treatment, withof disease, and also on the mortality? Both quest out the use of medicines, in the years 1875 to 1882 tions we must answer affirmatively. Observations at (inclusive), was 28 in 520 cases of the disease, while the bedside prove the first, and the concordant statis in the other divisions of the same military hospital, tics of the clinician the latter. We can affirm with in which a more mild water treatment was used with

more favorably and less dangerously shaped under judicious and antipyretic treatment; and, on the other hand, that the mortality of typhoid fever has fallen at least to one half its former rate.

Against these propositions different objections have been raised. On the one hand (Fiedler), the decrease of typhoid (both as to number of cases and mortality) in the larger cities, is referred to their health regula-In analyzing the views as to the value of antipy-tions, and certainly with truth. Our observations in retics we may group authors as follows: 1. The ex. Munich have shown the influence of these regulatremists, who use only the cold bath, and reject tions. Nevertheless, the relative decrease of morinternal antipyretics (Brand, Vogl, Winternitz and tality can scarcely depend on the healthfulness of the others). 2. Those who use luke-warm baths, but soil, but on the character of the epidemic, and doubtreject internal antipyretics (Naunyn and others), less also on the methods of treatment, as I will show 3. Those who, according to indications, use strict later. On the other hand (Port), the ratio of morand moderate hydrotherapy and internal antipyretics tality (the severity of the epidemic of typhoid) is (Liebermeister, Jürgensen, Riess). 4. Those who connected with the state of the soil-water. From imagine fever to be a kind of necessary and salutary the statistics of the Munich garrison for the last ten regulation, arrangement or mechanism, and use anti-years Port finds that the fluctuation of the soil-water pyretic interference only on the appearance of is more an index of the severity than of the size of dangerous conditions or complications (Heubner, the epidemic. From this he draws the conclusion Curschmann, and others). 5. Those who regard that antipyretic therapy is without any influence on fever as necessary, reject antipyretics, and only use the mortality, since the reduction of the former mordietetic measures (Glaser). 6. The class who ab tality from 20 to 2 per cent., as shown by the tables solutely deny an influence of therapeutics on the of the hospital of the Munich garrison, would be impossible without the discovery of a specific remedy. We thus see that all possible conceptions have But Vogl, chief physician to the garrison hospital,

Such works as that of Vogl are of the greatest pyresis with its satisfactory results, we should be value for the further development of the antipyretic drawn, by a reactionary movement, into the thera- therapy of typhoid fever, because they are based on pentic indifference of the Vienna school. Against very similarly situated material-strong young men such a movement, all who understand the subject, from 20 to 22 years under corresponding and almost and especially clinicians, must fight; and it is pleas- similar external circumstances-with well disciplined ing to know that at the IV Congress für innere Med-attendants schooled to a certain method-a cold icin those who expressed themselves against antipy- bath at 63.5° F. lasting a quarter of an hour (with a rectal temperature of 102.2° F.) about every three Has the antipyretic treatment of highly febrile infec- hours, winter and summer, in unheated rooms, with certainty that the course of the individual case is internal antipyretics, there were 52 deaths in 610 ¹Translated, by permission, from advance sheets by Wm. G. Eggles cases in the same time. This is, then, a mortality of ton; M.D., of Chicago.

this we may perhaps draw the conclusion that in military hospitals under the given conditions the energetic Brand's cold water treatment is superior to the litre of rum, 50 grm. sugar, and hot water). modified treatment, and that combined with antipyretics, and that, as a rule, it gives the best results in typhoid fever. This conclusion exactly corresponds to what has been the case in the Prussian army since 1865, since which time the mortality from typhoid the greater number of clinicians and physicians. fever has fallen from 25 to 8 per cent.; this, accord ing to the report of the Prussian Minister of War, is due principally to Brand's cold water treatment, though partly also to improved hygienic conditions and better individualization in treatment. The present results in the Prussian army are entirely independent of local, temporary, and individual influences.

But though these results, taken with the former publications of Brand, Jürgensen, Liebermeister, and others, show that there is no doubt that Brand's method is best in military practice, the case is somewhat different in civil practice. We cannot intro duce Brand's method directly into civil hospitals and private practice: there is a lack of trained attendants and that degree of discipline which forbids opposition on the part of the patient or carelessness on the part of the attendant; and again—and this is a most important point—the clinical material of the civil hospital and private practice is different and much less fit for such energetic cooling as Vogl carries out both by regulating the temperature of the barracks and the bath. Consider the circumstances of age, sex, anomalies of development, pregnancy, anomalies of constitution and nutrition, bad dwelling, inebriety, occupation, scrofula, tuberculosis, chlorosis, anæmia, cardiac affections, syphilis—these are the things with which, in addition to typhoid, we have to contend in our typhoid paitents in civil practice. The military physician should not forget them; he has a better mortality percentage because he has the flower of the youth of the whole country in his hands, with all uncertain and precarious constitutions excluded, while we have to treat the miserable people in all their unfavorable conditions.

With the strict Brand Vogl cold-water treatment we will now compare the results of a pure but somewhat modified hydrotherapy in a civil hospital. As representative of this method I place Naunyn before all others. He has not a large amount of material at his command, but it is large enough to cast into the scale. By his modified method Naunyn lost 10 of 145 cases, or 6.9 per cent.; certainly a favorable percentage. His method is as follows: When the axillary temperature (which is measured every three hours) reaches 103.1° F. the bath is given, usually eight baths in twenty-four hours, and in most cases between noon and midnight. Naunyn divides the baths according to temperature into: cold (72.5° to 81.5° F., duration five to ten minutes), luke-warm (from 81.5° to 90.5°, ten to fifteen minutes), and warm (90.5° to 95°). The warm baths are given in the great restlessness and muscular weakness. For sevtemperature than 72.5°. The diet consists of 1.5 in which there is no other trouble than high tempera-

a percentage of 8.5 by the combined method. From litre of bouillon with an egg, rarely two eggs, 1 litre of milk, 1 roll, 1 litre of water or 1.5 litre of wine or sometimes 1.5 litre of grog (consisting of 0.5

> We come now to those authors who use combined antipyresis, the combination of baths and internal antipyretics, according to the indications of the individual case. This group appears to embrace by far The statistics published by them correspond entirely, if we recognize the statement as correct that typhoid usually gives a less mortality in small than in large With this method of combined antipyresis there is great play for modifications of the methods of treatment, and it is not impossible that the methods of the clinicians using this are all different. The cold, luke-warm and warm baths, the gradually cooled and the prolonged luke-warm bath, the cold douche, the moist pack, the cold fomentation, the simple sponging, and of internal remedies quinine, antipyrin, thallin, salicylic acid, kairin, hydrochinone, antifebrin—all these have their friends and supporters.

You will now ask: Which method of antipyresis shall we employ in our cases? What kind of hydrotherapy shall we use? And under what circumstances shall we use antipyretic measures? Our discussion of these points must begin with a consideration of those changes which antipyresis is intended to and can control. As the name shows, it was at first thought that the object of antipyretic treatment was the fever alone, and the factors from which the conception fever arises, principally the high temperature of the blood and tissue. This opinion, which was mainly defended by Liebermeister, arose from the idea that the high temperature of itself, especially if of long and uniform duration, was dangerous, and threatened life. There is no doubt as to the dangers of hyperpyrexia, but it seems that the high temperature has usually not the significance which Liebermeister at first attributed to it. The severe cerebral symptoms, the cardiac degeneration, renal troubles, the trophic disturbances, do not seem to be the effects of the high temperature, but coeffects of the dangerous process, the infection, causing the fever.

We may now answer the question as to what antipyresis should do, by saying that we must first widen our conception of the word; it is not merely a battle against fever heat and its action, but also against the carriers of infection and their destructive products and actions in the organism. To take an exact position between the fever action and the microbe action is not possible at present. Naunyn has cleared up many points, but much is still dark. Naunyn con cedes the acceleration of the heart's action and respiration as the influence of over heating. The troubles of the nervous system, of the blood and its vessels, of digestion, of tissue change and secretion, he places to the account of the infection. But the proofs which Naunyn gives are mostly of a negative later stages in very actively delirious patients with nature, and there are still many doubts, especially as regards the nervous and circulatory troubles, as to eral years Naunyn has not given baths at a lower the innocence of the fever. The cases of aseptic fever,

ture, are very exceptional; and we must also regard tion a favorable influencing of the general condition as exceptional those cases in which, especially among is not to be mistaken. The action of cold and lukethe lower classes, the nervous system is but little or warm baths may perhaps be defined as follows: The not at all affected by the fever, so that the patients bath acts on the fevered organism by cooling the continue to go around, and even to work for days blood at the periphery, and then by the return of after the beginning of the disease. Against these the cooled blood from the skin to the interior of the we may place those cases of extreme susceptibility body and to the internal organs. Whether this to fever, usually occurring in persons of nervous stream of cooled blood has an immediate effect on constitution.

may be conditional upon the infection, as shown by regard as the most distinctive action of the cold bath. the cases with severe prostration of cerebral function. The excitation experienced by the sensitive nerves fever, for example, the early loss of consciousness transmitted centripetally, and acts to a greater or and the active delirium in the first days of typhus less degree on the important nervous centres. The fever, the severe nervous troubles in many cases of lowered excitability of the brain is raised, and from acute sepsis, in which there is no or but little fever, the refreshed centre goes out a fresh innervation of In the same way are the boundaries between the limits the circulation, respiration, digestion, tissue change of action of the fever and the infection in the circu- and of the motor apparatus. The effect is a restful latory and respiratory troubles uncertain. That the sleep, a clear sensorium, a fresher look, active moveacceleration of the heart's action and of respiration ments, and a surprising desire for food. depends on the fever may perhaps be regarded as proved, as it is probably proportional to the relaxa- beginning with the improvement of digestion, it must tion of the vascular walls, which may be recognized, must be said that there is not only an increased deby the constantly noticeable dilatation of the arter sire for food, but what is taken is more perfectly diries and capillaries during fever, as well as by the gested than before. This shows that there is an insphymographic tracings. The relaxation of the pe- creased secretion of the digestive fluids, which is ripheral vessels which is peculiar to fever can be probably to be ascribed only to better innervation. attributed to nothing else than paralysis of the vaso-| We can in this way feed the patient very differently; constrictor nerves, since, as Bäumler has shown, the and this is of great importance in long continued reaction of the vasculars to irritation of the skin (stroke with the finger nail) is very prompt. If, then, the troubles mentioned are caused by the fever, we must, on the other hand, refer the nervous troubles, disturbances of organic tissue-change, of the quality of the blood, and of secretion, perhaps entirely or in the greater part to the infection: the paralysis of the heart, the reduction of the number of red blood corpuscles, the deficiency of alkali and carbonic acid in the blood, the generally increased excretion of urea (especially the large epicritical), the albuminuria, and the trophic disturbances of the muscles and skin.

We will now consider the antipyretic measures in connection with these disturbances; how and to what extent the former affect the latter. Hydrotherapy deserves to be considered first; according to the experience of all competent observers it has the first ripheral irritation to deeper and slower movements. place, because it combines in itself all the attributes. The improved sensible innervation of the mucous of a remedial measure necessary in these cases, and membrane supplied by the vagus causes reflex cough, its action on the fevered organism may be varied to any degree. But the mistake must not be made of this way the formation of bronchial obstructions, supposing that the favorable action of the cold water treatment has been particularly proved in typhoid than by the usual advice to turn the patient on the fever, whilst in other febrile diseases, such as pneu-side from time to time; a recommendation which I monia, erysipelas, and acute phthisis, it is shown to think purely theoretical, since, on the one hand, a be much less applicable. In the last-named affec- typhoid fever patient cannot remain on the side for

the central nervous apparatus is not certain, but I I mention these things in order to show that the believe I may conclude from a personal experience absence of nervous symptoms in individual cases (a severe attack of typhoid fever in 1874, during does not prove that as a rule there are no nervous which I was bathed a great deal) that the immediate troubles in fever as such, but that they depend on effect after the bath and the first effect of it is a senthe infection. Following this directly cooling effect is the refresh-On the other hand, I think that the cerebral troubles ing action on the central nervous system, which I with comparatively low temperature, as in typhoid from the low temperature of the bath is at once

> To speak more particularly of these effects, and fevers, such as typhoid. The circulatory apparatus receives its waves of excitation from several sources: by way of the reflexes, a direct excitation from the cutaneous vessels, and finally the excitation of the heart muscle from the cooled blood circulating through it. The succession of phenomena is as follows: The first perceptible action of the bath is the contraction of the peripheral essels (often to the extent that the pulse disappears), so far a direct action; then increase of blood-pressure and overfilling of the vessels in the internal organs, and after a time relaxation of the peripheral vessels and invariable persistence of the high blood-pressure. The heart works slowly and forcibly, the vessels show an improved tension, as recognized by the decrease of dicrotism and the return of the elasticity-elevation.

The respiratory apparatus is excited by the peby which collected secretions are thrown off. In atelectasis and catarrhal pneumonia, is better avoided

is shown by the non-appearance of bed sores, etc. must always use the mildest measures when it can Besides the trophic innervation the conditions of the be done without injury to the effect desired. The circulation (blood-pressure, rapidity of the circula- miserable condition of a patient for an hour after a tion and vascular dilatation), also play an important too cold bath, and the frightful appearance which he part here.

treatment is determined by the indications of the in-refreshing, an enlivening action on the nervous sysdividual case. The complete bath must be regarded tem, not depression or shock. For twenty years, as the most effective, convenient and pleasant form of hydrotherapy; in this all experienced observers the gradually cooled bath, and I can now most highly

are agreed.

The temperature of the water and the duration of the bath are regulated by the stage of the disease, the height of the temperature, the quality of the heart's action, the condition of the nervous system and the general constitution of the patient. We may say generally, the more recent the affection, the higher the temperature, the more resistant the heart and nervous system, and the stronger the constitution, the colder and longer is the bath, and the more frequently is it to be repeated. Very low temperaroom is very pleasant. The patient is placed, as often as necessary in twenty four hours, in the same a rule, however, a temperature of $65\frac{3}{4}$ ° is too low.

The average duration of the bath should be from fifteen to twenty minutes. The number of baths in twenty four hours varies according to the intensity mine when the bath is to be renewed, by the tem icised as routine practice, but as a rule it is correct. Frequently there are cases in which we must order the bath when the temperature reaches 102.2, and other cases in which we do not, or generally do not, bathe even at 104°. In my opinion the reaction of the patient after the first bath is an important point, and this is best determined by the condition of the nervous system, the pulse, and by the subjective

a long time, and, on the other hand, the former con- of the body is very important, but this is not the ception of the mechanical origin of hypostatic pnen-lonly thing to be considered; some constitutions are monia is, in my opinion, very faulty. In other cases, especially of nerthat the collection of mucus and the consequences vous constitution, the action of cold baths is often of bronchial obstruction, atelectasis and catarrhal unsatisfactory. True, the temperature goes down for a few hours 3.5° or 5°, but the patient feels un-The visible secretions, the urine, the saliva, tears comfortable, chilled, and has not the desired re-

You must consider that in private practice attention must be paid to the subjective sensation of the Finally, the favorable action on the trophic spheres patient, and to the sentiments of his friends, and you presents, will not add to your reputation. And the The form, duration and temperature of the water- bath has here failed of its purpose, since we wish a therefore, I have recommended for private practice recommend it after an experience with thousands of cases of typhoid fever and other infectious diseases.

The patient is placed in a warm bath of 90.5° or 86°—this is always 14° or 18° below the temperature of the body, and in proportion to it is still to be considered cool-and then the water is continually poured over him with the hands or a large sponge. While this is being done cold water is very slowly poured in at the foot of the bath tub, and thus the temperature of the whole bath is gradually lowered to 77° or 72.5°, until the patient's teeth clatter, or he tures for the bath have been lately discarded by the declares that he cannot stand it colder. The pagreater number of authors, and it is seldom that a tient must now remain in the bath as long as possible, temperature lower than 65\(^34\)° is used. In most cases say fifteen or twenty minutes. He is then taken I use baths between 72.5° and 86°, according to the from the bath and placed on a blanket, previously individual constitution, though in early cases, with warmed, and he is wrapped in this without being strong constitution, baths of 63.5° to 65¾° are fre-dried. In this he remains in the greatest comfort quently given. The bath at the temperature of the for a quarter of an hour, when he is rubbed dry, clean linen put on, and he is allowed to sleep.

By this form of bath we have entirely in our hands water, this being renewed only in the morning. As the degree of reflex action desired, and at the same time as a measure of the amount of action we have the objective state and the subjective feelings of the patient. The cooling of the blood by the gradually cooled bath is not less, though the sensation of and resistance of the fever, between two and six; I shock is absent, than by the very cold bath, because seldom use a larger number. We can best deter- the bath can be kept up as long as desired. And I think it better to fall a little short of our purpose by perature. Brand's recommendation to bathe when the use of the warm bath than do too much by the the axillary temperature reaches 103.1° must be crit-cold bath. In regard to the individual expressions of physicians who do not recommend the gradually cooled bath, I can only attribute them to insufficient experience. But I can say that every physician who, like myself, has had personal experience with the different forms of baths, both on patients and himself, will endorse the luke-warm and gradually cooled baths.

Warm baths of 90.5° to 95,° though not much becondition. Of course the effect on the temperature low the normal temperature of the body, are never-

actions of tolerable warm baths seem therefore as well as its cheapness. praiseworthy. A sleep after the bath is especially Of the methods of using these drugs, of their important, as by it the brain has a rest which it ob- principal and secondary effects, I will speak more nervous system has been quieted to some extent we phoid fever. can very soon follow the warm with the gradually cooled bath, and even with baths at 77° or 72.5°.

It would of course be very wrong to have the same bath-temperature for every case and for every stage. Individual indications are here very necessary in order to obtain the proper effect. Not only do different constitutions and different conditions of infection need very different temperatures and forms PNEUMATIC DIFFERENTIATION AND THE PNEUof baths, but the temperature of the bath should vary a great deal in the course of the same sickness. In the case of a weak, nervous woman who comes under your care in the second week of a neglected typhoid the condition of the nervous system, of the temperature, pulse, etc., will show that you can only use warm baths of 90.5 to 95,0 and perhaps add a short douche or a wet-sheet. If the action on the pulse, temperature and nervous system is satisfactory, the bath temperature on subsequent days may phthisis. Certainly as far as indications for treatbe lowered to 86°, and later even to 77, with from ment are concerned, the all imporatnt question to four to five baths a day. But in the third week, decide is, when does a degenerative process in the when there are spontaneous morning remissions, lungs become tubercular? We know that two contwo or three baths of 90.5° may be given each day, ditions are necessary: 1. Susceptibility or soil. 2.

The indications for the temperature, frequency Impregnation and germination. and duration of the bath also depend upon the needs of the individual case. The sum of the symp- corded the clinical evidence of the liability of even toms, the whole clinical picture and the influence upon the simplest bronchial catarrh to become an unconit of the first baths, but not the effect on the tempera trollable phthisical degeneration. They also recorded ture, should alone serve as guides.

short and not too cold douche in the warm bath may atmosphere. It is possibly true that the bacillus of be tried in severe asthenic forms of the different tuberculosis may find its way into the animal econacute infectious diseases, and is often well borne, omy through the stomach or by the abraded mucous This is especially the case in those infections whose or cutaneous surfaces. It is absolutely sure that a course is rapid, as scarlatina or small-pox, and in tubercular person in an ordinary dwelling, theatre, which all therapeutic measures must be carried out church or closed vehicle, will contaminate the air to in a few days.

sidered as having much of an antipyretic effect, as that prevent germination in such exposures are not its temperature is very soon raised to that of the understood, but vital resistance is the term that thus uses, have a marked local cooling effect, but the to establish and maintain the normal equilibrium beeffect on the temperature of the body is inconsidera- tween carbonic acid and oxygen, and the intelligence tipyresis than for antiphlogosis, as in combatting acts of involuntary protection. We are told by san-

theless 12° or 14° below the fever temperature, and think that the opposition to them has gone too far. while the reduction of temperature is not inconsid. The more recently discovered substances of this erable, it is insufficient, and the reflex action is very class excel the former both in a more certain antipyslight. The warm bath is therefore especially suita- retic action, which is almost without unpleasant acble for those cases which the older physicians de- companying effects, and in the much smaller dose scribed as febris nervosa versatilis, cases which have required. As for the individual drugs, my experithe character of irritable weakness to a marked ex- ence is that the earlier ones, quinine, conchinine, tent. Such cases, in which the infection so fre- salicylic acid, hydro-quinone, resorcine, and others, quently shows a malignant character—we see are surpassed by antipyrin, thallin and antifebrinthem in measles, scarlet lever and small-pox as well. Antifebrin is superior to antipyrin and thallin both as in typhoid and other affections—bear the shock on account of its more certain effect (which is of a cold douche or a cold bath very badly as a rule, almost entirely free from unpleasant accompanying at least at first; and the subjective and objective effects), and on account of the small dose necessary

The inspiratory act becomes long, deep tinually placid glottis would drown us in a moist atand forcible. The air is fairly aspirated into the thor- mosphere, or parch and crack our inter-bronchial ax; the expiration is short, and in the sound sleeper the mucous surfaces in a hot dry atmosphere. This can vibrating nares hardly remit their sonorous rattle be- be shown by the behavior of the glottis in the Rusfore the hungry lungs are again impelling the air with sian bath, where the glottis remains wide open dura faithfulness that nothing but their supreme function could demand. Sleep is "nature's great restorer" when conducted in compartments with unlimited supplies of pure air. Recent experiments prove that amount of moisture upon the mucous surfaces. It bacterial germs which are inevitably introduced into the air cells through the polluted air of seggregation, are annihilated by the voraciousness of the tissue ion, are rendered obtund by moisture and the recells with which they come in contact when the vital resistance of the cell is at the standard of health. Normal sleep then may be a virtual antiseptic process.

It is probably true that the lungs of every man, pulsion of abdominal contents. woman and child in this city have almost daily visitations from circumambient microbes. The bacillus of tuberculosis is no small minority of the sum total, but so long as the lung tissue is maintained at its normal point of vital resistance, the bacillis are in nocuous. Pulmonary indolence is the first step to susceptibility.

From such insidious causes down to the most sthenic inflammation that may attack the lung itself we have every gradation of power whose sequential direction is the destruction of the vital resistance. The soil is now ready, impregnation takes place, germination follows; the bacilli seize upon the stagnant lungs, invade the guarding tissue cells, gain an entrance into the blood and lymph channels and the citadel is at once in a state of siege.

From this brief outline it is plain to be seen where we must direct our treatment. I have referred to the indications for treatment in most of the simpler conditions that lead to the graver septic pathological by Mr. Ketchum in his study of the mechanism of conditions. I will now refer to that department of the inspiratory act; but let us see how this may be my subject which treats of topical medication.

First, is it possible? One can hardly study the mechanism of the human body and fail to discover the evidence of adaptation of ends to means. We have only to discover the function of a given part or section, when we shall surely find no bungling mechanism that permits or compels its perfect action. We are not to forget that the inexorable laws of complemental saturated air. At this juncture, had physics find their supremest expression in the constant | 1 Medical Record, Jan. 9, 1886.

Joseph Ketchum, by a process of synthetic reason-In a condition of robust health, the fatigue of the ing reached the conclusion that in respiration there ing expiration. The respiration of dry air will cause the glottis to contract during expiration, thereby retarding the outflowing air, and keeping a sufficient would seem that the terminal nerve filaments which convey centric impressions from the glottidean regverse by dryness. It is needless to refer to the comprehensive action of the glottis when upon a full inspiration, it is instinctively closed to effect the ex-

In studying this unique mechanism we find it of far more importance than physiologists have ascribed to it; and to maintain its healthy action or to supplement it is the key note to the question of topical medication. I have shown how by forced inspiration and inspiratory differentiation it is possible to convey spray and vapor deeply into the pulmonary structure. It remains to describe such other means within our control as will surely condense saturated air in interpulmonary spaces and cavities.

This contemplates the principal act of the entire differential scheme, viz: Respiratory differentiation. In this act with a variation of, say one inch Hg. from minus to plus, the weight of the normal air with each inspiratory and expiratory act, we are now compelling the circulation of a corresponding increase in complemental air in the complete respiratory act. There must be in this act an assertion of the power of the physiological action of the glottis, as described supplemented.

The patient makes a full inspiration through the ordinary capacious breathing tube, breathing a saturated vapor for temperature and density of air, with the assistance of one inch Hg. minus the weight of normal air i. e., rarefaction. Now, with this act, we have our ordinary quantity of inspired air, plus the

Sixth, primary hamorrhage must be treated by shall prevent it from responding like the other tissues of the body to well chosen antiseptic agents. general tendency in the profession now is to discard polytheraphy, and especially in the conservative measures of antiseptic, surgery; and if we are to indulge the hope of the discovery of an efficient germicide against the bacillus of tuberculosis, we must select single agents and follow them to the finish. Where such agents are vaporized as by Dr. Mc-Caskey's vaporizer2 their doses must depend upon their point of air saturation, but when projected by spray they must bear a certain per cent. of the solution sprayed. Glycerine, cosmoline, and agents of like specific gravity make a seductive spray, and perhaps in appropriate conditions an effective one; but for a pure antiseptic effect we are not to forget that impure glycerine, the sugars and oils may be efficient cultivating mediums for bacterial propogation, and if successfully impelled into pulmonary spaces may make a rich pabulum for the microbe we are seeking to destroy.

²Dr. George W. McCaskey, of Fort Wayne, Ind., an earnest colaborer in this work, has devised a vaporizer, whereby we can keep a cubic foot of air saturated with the vapor of any agent. An article descriptive of this will shortly be presented to the profession by Dr.

How far this may apply to moist agents of any description can only be determined by careful and continued study. If we are to reason from analogy or to act on the hints that we gain from the study of Read before the Chicago Medical Society, April 18, 1887. climatic treatment, we must primarily conclude that cases that should do well in warm, moist atmospheres of southern climates will do well with antiseptic vapors and spray; while those cases that should show improvement in cold, dry climates would best respond to dry dehydrating agents. The range of medication being so thoroughly under our control, it must require as good judgment and discrimination as by internal medication. I have found a hint in treating some cases, by changing as much as possible the character of the air from that in which the disease developed, and I have further found preliminary course of cabinet treatment to materially aid me in the selection of climate for individual cases. While the rapid improvement that has super vened upon a climatic change, after a preliminary course of pneumatic differential treatment may be ascribed to the effectual expansion thereby induced, I am sure I am warranted in my conclusion that a measure of the benefit is due to thorough disinfection of the lungs and the evidence gained of the patient's tolerance of moist or dry air, as the case and Septicamia by the means of Gaseous Enemata ac-

I will mention a few of the most important agents that I have thus far used: Dry air, this can be easily furnished by attaching an U tube to the breathing faucet, and packing the tube with pumice stone and pure sulphuric acid; or absorbent cotton borated or mercurialized may be loosely packed in the tube.

The bichloride of mercury in solution of a strength

of $\frac{1}{500}$ to $\frac{1}{20000}$.

Lugol's solution to to 50 per cent.

Creosote to to 50 per cent.

Pure carbolic acid 10 to 50 per cent.

of pure glycerine and water as diluents.

Oxygen gas and the per-oxide of hydrogen may be appropriately applied. I am now using C. P. glycerine as a de hydrating and disinfectant spray.

As emollient and sedative applications I have used morphine, cocaine, atropia, stramonium, and a

weak emulsion of peppermint oil.

It is unnecessary to make further reference to special agents. The list is as extensive as the materia medica, and as in other departments of medicine, each practitioner will find certain agents to behave better in his hands than in those whom he seeks to instruct, yet as there is probably but one best way to do everything, it is equally probable that there is but one best bacillicide and one best opportunity destroy it, or at least to neutralize its action. For for its perfect work.

450 Classon Avenue, Brooklyn, N. Y., April 26, 1887.

BERGEON'S METHOD OF TREATING PHTHISIS BY GASEOUS ENEMATA.

BY FRANCIS J. CRANE, M.D.,

OF CHICAGO, ILL.

In January last, the N. Y. Medical Record contained an article headed "A New Treatment of Phthisis," which gives a brief outline of Dr. Bergeon's method of administering carbon dioxide mixed with sulphuretted hydrogen gas, and referred to an article published in the British Medical Journal, of December 18, 1886. This described in full the apparatus and mode of using it, and stated they had been procuring beneficial results by the method, and that Professor Cornil, of Paris, had also become an enthusiastic supporter of it. This led me to write to Dr. Bergeon, and in the course of my correspondence, he presented me with an apparatus, as well as with the treatise of Dr. Morel read before the French Academy last June, and also one by Professor Cornd. These are so exhaustive that I have embodied in this paper only the essence of both, as follows:

New treatment of the diseases of Respiratory Organs cording to M. Bergeon's Method. By Dr. V. Morel. It would seem from the statements of physicians who have tried either to prevent the development or the proliferation of the bacillus, or to destroy it, that it is the one thing which we have to overcome in the treatment of phthisis. In reasoning by analogy with other contagious diseases, as, for instance, cholera and hydrophobia, it might be urged that the bacillus is not the immediate cause of the morbid phenomena of tuberculous affections. It is known that, aside from miliary tubercles, which invade the lungs and are the cause of the patients' symptoms, the gravest In using the last two agents I have projected the phenomena of phthisis are due to the septicæmia, which spray with the "Semple Inhaler," using equal parts poisons the patient, and is caused by the suppuration of the tubercles, which, brought in contact with air, undergo putrefaction and are absorbed into the The bacillus' work, then, by producing lesions of texture, which become fatal to the organism by rapidly destroying or, by undergoing softening and absorption, produces septicæmia. To use Darembourg's expression: "The bacillus is nothing, but septicæmia is everything."

In acknowledging that it is not necessary to ascribe to the microbe all of the morbid phenomena of phthisis, it is not less true that its presence is to the organism an incessant and real danger, and that consequently, in endeavoring to discover a remedy for the lesions which it has produced, it is necessary to this purpose such agents as sulphuret of hydrogen, bisulphide of carbon, and other antisepties mixed with pure carbonic acid, are employed.

Principles of Bergeon's Method.—The first mode of treatment thought of consisted in applying by inhalation some substances having parasiticidal properties. It is known that antiseptic substances are poisonous when introduced into the arterial system, either directly or by inhalation. Claude Bernard has

rial system through the lungs produce toxic effects towards a state of health with all the signs of cure. almost instantaneously. Besides, the antiseptic substances have an irritating action, and this action, method, I can now assert that the results I predicted operating on diseased lungs, will only increase the three months ago have been achieved. The patients existing lesions, while their unpleasant odor aroused that I considered cured have no more expectoration, a refusal in the patients to their use; this is probably and give on auscultation stethoscopic signs which the reason why so little success has been obtained by denote the presence of quiescent cavities, or cicainhalation in the treatment of phthisis, and is con trized lesions. Some of these patients have been clusive proof that the introduction of antiseptics by obliged to return to a life of labor; nevertheless their the stomach is preferable, for Cl. Bernard has shown respiratory organs have stood the test, and the amethat when a poisonous or medicinal substance is in-lioration obtained has been permanent. troduced into an organ distant from the arterial system; into the digestive tract, for instance, it cannot so exhausted, now have only 3 or 4 grams of sputum enter the arterial system, because it is expelled before a day, at the beginning of the treatment it was reaching it. It must pass through the portal system, from 250 to 300 grams. We have found bacilli, it is the hepatic veins and the pulmonary texture, there true, in the sputa of these patients; yet it remains to to be exhaled, or it can be expelled in the liver with be discovered whether these bacilli which continue the bile.

troduction of poisonous substances into the digestive mode of action of carbonic acid introduced by intube may be done without danger by taking certain, testinal absorption in the venous blood and afterward precautions, of which the most important consist in expelled by the lung, it can be said from the obsernot injecting too large quantities at once. and not vation of patients, that this gas, filled with proper injecting more before the first has been completely medicinal substances, greatly modifies the respiraeliminated. What avenue ought to be chosen? The tory function, and makes the hæmatosis more comstomach or the rectum?- In both cases, the medicament will have to pass through the portal vein, the followed by an increase of strength and weight, a liver, the hepatic vein, the right heart and pulmonary diminution of fever and night sweats. arteries, but we think the rectal way is preferable, for the patient cannot take a dislike to the antiseptic giving this treatment: 1. The CO2 ought to be as substances on account of their disagreeable odors.

Gaseous Enemata in the Therapeutics of Respiratory Organs, Pulmonary Phthisis, Asthma, Whooping-cough, Bronchitis, Bronchiectasis, Broncherrhwa, Pulmonary Catarrh. By M. Cornil.¹ The principle of the action of gaseous infections and of their rapid elimination by the lung, has been given by Cl. Bernar l. He showed that when sulphuretted hydrogen is injected into the rectum of an animal, the gas is expelled by the lungs; he proved that we can so inject it in almost unlimited quantities, without causing harm; whereas its introduction by inhalation rapidly occasions grave accidents and the animal's However, to introduce sulphurous hydro gen, or any other gas or vapor, into the economy per rectum, for the purpose of destroying the microorganisms which exist in a number of diseases, it was economy, and easily tolerated by the bowel.

Carbonic acid gas admirably answers the purpose; it is very easily borne by the colon, rapidly absorbed and afterward expelled by the lung, with the medicinal gas which it holds. This gas itself, in all probability, plays a very important part in this new treatment of pulmonary diseases.

Dr. Bergeon, who inaugurated this method, published a few months ago the first results obtained in the treatment of pulmonary phthisis by this method. Physicians of Lyons, Paris, Geneva and Marseilles who have treated phthisis by the method, have generally obtained a very rapid disappearance of the phe-

shown that poisonous gases introduced into the arte-nomena of pulmonary suppuration, and a progress

Concerning the patients I have treated by this

While many patients whom the expectoration once to exist after the return to health have kept their It is well established by experiments that the in-functional activity or not. Whatever may be the plete and easy. It gives a sensation of well-being,

The following precautions must be observed in pure as possible, so as not to inflame the bowel. That obtained by the reaction of dilute sulphuric acid on the bicarbonate of soda has always been perfeetly absorbed by the bowel without producing any toxic effect.

2. The gas should be collected in a receiver from which the air has been expelled.

3. Make the injections just before a meal, or at least three hours after, and never when the patient is weary. It is necessary to be very cautious in experimenting with other medicinal substances, for if, although the sulphuretted hydrogen is inoffensive, other agents, as turpentine, chloral, ammoniæ, iodine, bromine, ether, etc., may not be, and might be the cause of an inflammation of the intestinal mucous mem-

It is not necessary that the dose be large; by innecessary to find a gaseous vehicle, inoffensive to the jecting twice a day 4 or 5 litres of carbonic acid gas passed through 500 grams of sulphur water, we rapidly notice the disappearance of all the phenomena. of pulmonary suppuration, either in its acute or chronical state.

Bergeon's method has been successfully experimented with by Dr. Chantamesse, in his service at St. Antoine Hospital, during the months of August, September and October. The following are his results: "Two patients brought to the hospital suffering with violent attacks of asthma were, half an hour after the injection with sulfo-earbon vapors, entirely relieved of the dyspnæa. The treatment having been continued for a few days, the breathing was relieved, and the attacks were not repeated during the time they remained." Nine patients giving general

The pulse betion of glairy mucus; decided dulness on percus-came more regular, and his general condition gradusion over the lower lateral and posterior part of right ally improved. The temperature remained below side of chest; crepitant râle heard below the axilla normal until May 18. The heart difficulty subsided of the same side; tongue coated with a light fur and after a few days, and patient was able to be up in two bowels constipated. I directed poultices to be ap- weeks. There was slight atrophy of left testicle, but plied to right side of chest and sweet oil to the testicle; gave a powder of calomel and jalap to move bowels, and gr. viij doses of quinine were ordered to tis, is an event much to be dreaded, and was caused be given every four hours.

March 5. The swelling in both parotids had entirely disappeared; left testicle not so much swollen, but still very tender on pressure; temperature 104, pulse 110, face flushed and profuse perspiration; respiration 40, expectoration still scanty and streaked | Both parotid glands were affected, and five days afterwith blood; percussion and auscultation showed an increase of dulness over the right lung, with mucous râles in that region; tongue coated. The bowels had moved freely the day before; urine scanty and to syncope, followed; that evening he had a chill, high-colored. The same treatment was continued, and soon afterwards a high fever. On January 20 and in addition egg-nogg was ordered.

weak, respiration 50 and difficult. Skin bathed in fur; partial paralysis of right upper and lower ex-

when metastasis to the testicle takes place. Under sweat; increased area and degree of dulness over some conditions, however, it develops an intensity right lung, with mucous râles; retention of urine; of action which is quite unknown to the ordinary tongue covered with a dark-brown coat. Patient becourse of the disease. During the winter of 1886, came unconscious; respiration more frequent and mumps appeared as an epidemic in and about Ord; difficult; expectoration abundant; countenance livid not many children escaped, and a good proportion and swollen. He gradually sank into coma, which of adults were attacked. Among the latter were an deepened until it ended in death at 1 A.M. March 8,

This was evidently a case of embolic pneumonia,

fatal cases occurred near Ord, about the same time, Mr. J. V., a married man, about 28 years of age, under the care of Dr. Klinker, who has kindly given whose prostration and general appearance indicated me the history of these very interesting cases. One alarming illness. I was informed by his wife that he was metastasis to the liver, causing abscess which was taken with mumps on May 5, and seemed to be of a seven months' fœtus and premature labor, fol-tele became the seat of trouble. His condition did lowed by the death of the mother on the second day not become alarming until May 13, when he had after her confinement. A record of these fatal cases, a sinking spell with pain over the cardiac region; and of one which recovered, I think of sufficient in- the pulse was irregular and feeble. A physician was called in, and treated the case until May 16, Case 1.—A young man, 28 years of age, was taken when I was requested to take charge of the case. with mumps February 25, 1886. His general health His condition at this time was as follows: The previous to this time had always been good. The surface of his body was cold and drenched in perdisease progressed favorably until March 1, when spiration; temperature 97°, pulse 50, small and interno other bad results remained.

> The metastasis to the heart, producing endocardiin this case by septic infection of the blood.

Case 3.—Is one of the cases which occurred in the practice of Dr. Klinker, and the record given to me is as follows: Mr. N., aged 21 years, had an attack of mumps which dated from January 13, 1886. wards both testicles became tender and swollen. On January 10 the swelling in both parotids began to subside and a feeling of weakness, with a tendency Dr. Klinker was called, and found his temperature March 7. Patient's condition much worse. He 103°, pulse 120 and very weak, profuse perspiration, was propped up in bed, as it was impossible for him pupils widely dilated, tenderness over liver with conto lie down. Temperature 106, pulse 150 and very stant pain in that region; tongue coated with a light

tremities. Did not see patient again until January different liquids of the body, but principally in the 23. The temperature at this time was 104, pulse blood and in the urine of patients suffering from 130, profuse perspiration, with hurried breathing; mumps, micrococci of a special form. These results right hypochondrium tense and painful on pressure, were constantly obtained in patients suffering from very distinct jaundice; the paralysis had changed to mumps. Similar researches were made on children the left upper and lower extremities. The right thigh in health, and the results were absolutely negative; a became very much swollen at this time, and an abscess fact which shows that there is something specific in formed, which was not opened.

the mouth, throat and lungs so as to produce immediate death by suffocation.

Case 4. Mrs. D., 20 years of age, in the seventh month of pregnancy. She was taken with the mumps on April 1, 1886. April 5 the swelling suddenly left parotid glands, and she became very nervous and weak; complained of pain over the hypogastric region. Dr. Klinker reports that at this time her temperature was 1043, pulse 120 and feeble. There was pain and tenderness over the womb, with constant vomiting. Her fever continued high throughout her illness.

April 10. Active labor pains set in, and she was delivered of a seven months' feetus, which had evi dently been dead several days. The placenta came away, and with it a very profuse and offensive discharge. The patient became delirious, and died April 12.

I find in looking over the literature of this common disease, that metastasis to the cesophagus is mentioned by Dr. Richard McSherry, of Baltimore, Md.; to the kidneys by Dr. Croner, of Berlin; and deafness coming on during an attack of mumps has been recorded by Dr. A. H. Buck, of New York. Dr. H. V. Logan¹ gives the record of a very interesting case, in which there was double metastasis, and subsequently thrombosis occurred in most of the superficial veins. The left parotid and right testicle were involved at the same time; twenty-two days afterwards the left testicle became involved, and on the fortieth day of his illness inflammation of the right parotid gland set in. These facts indicate the serious nature of the disease, and, as I have already shown, there may be various other complications; which are to be very much dreaded. There are no other examples of metastasis so complete and satisfactory as that of mumps, and bearing in mind that both testicles are not unfrequently inflamed during an attack of mumps, it seems very probable that, in and give rise to more or less disturbance.

malady has long been known, but what the nature of of his researches on pyridine and allied basic subthe contagium was, has not been so well understood. stances (collidine,) and draws the following thera-Dr. A. Ollivier, Physician to the Children's Hospital peutic conclusions: 1. The pyridine is indicated in in Paris, has made some researches with a view of attacks of angina pectoris. Its effects are very ascertaining the correctness of the results previously rapid. Its use prevents other fits. 2. In asthma, obtained by Drs. Capitan and Charrin, who had been be it of nervous, emphysematous, or catarrhal naoccupied in the same line of research. Like these ture, in the pathological as well as in the sympto-

the disease under consideration. As it has been January 26. Patient semi conscious, and breathing shown that the development and propagation of with great difficulty. During an effort to cough, there mumps is due to the presence of micro organisms, came a large gush of dark purulent matter which filled it should be considered as an infectious or contagious malady, and should therefore be classed with measles, scarlet fever, small pox, etc.

[Note-Since preparing the above report, I have met with a case which shows the importance of this subject, and one of the mistakes likely to occur as a result of complete atrophy of the testicle following mumps: While in Omaha last month I was in the office of Dr. W. S. Gibbs, of that city, when a patient came in who had just met with an accident. It seems that, during an attempt to lift a ladder, he felt something give way in his right groin, accompanied by severe pain and faintness. taken to a physician who after an examination, found a tumor in the right inguinal region. After an ineffectual effort to reduce it, and finding that there was only one testicle in the scrotum, he pronounced it a case of partially descended testicle. The patient not being satisfied and suffering intense pain, came to Dr. Gibbs's office. We found a tumor the size of a walnut, and about as hard, lodged in the right inguinal canal; there was only one testicle to be discovered in the scrotim. After inquiring into the history of the case, we found that during boyhood he had the mumps, with metastasis to the right testicle followed by complete atrophy of that gland. The diagnosis of inguinal hernia was then made clear. Dr. Gibbs succeeded in reducing it, after passing his little finger to the seat of stricture at the neck of the sac, and by a process of tearing enlarged the opening sufficiently to allow the strangulated intestine to pass back, when he employed gentle taxis.]

My principal object in this paper has been to call attention to the seriousness of the results frequently attending these epidemics. No doubt some of the many pages of medical literature devoted to diseases which a busy practitioner might not see once in a lifetime, might profitably be given to the discussion of this most common ailment. I have availed myself of every material source of information within my reach, and deeply regret that more has not been published in an accessible form, to aid us in meeting the many indications which are frequently present in this common malady.

MEDICAL PROGRESS

Pyridine in Asthma.—Dr. Wyss, of Geneva, in many cases, the infectious material enters the circu-: Der Fortschritt, No. 1, January 5, 1887, commenting lation and, in passing through organs having a very on the treatment of asthma with pyridine, writes: complex circulatory apparatus, is apt to be arrested. The physiological and therapeutical properties of pyridine was investigated by Professor G. Sée. His That mumps is a contagious as well as infectious pupil, Dr. Dandien, recently published the results two experimenters. Dr. Ollivier discovered in the matic asthma, the effects of pyridine are superior to those of injections of morphia; they are of longer

Furthermore, the sothere is some doubt in regard to the favorable influ-called catarrh of the pharynx, larynx, and trachea ence of our measures upon the local diseased condi- are merely secondary to this condition, and not distions of the upper air-passages. The question was eases in themselves, being amenable only to treatdiscussed by Drs. F. H. Bosworth, Andrew 11 ment directed to the real seat of the disease—viz., Smith and W. H. Thomson.

Dr. Bosworth takes the ground that when we knew little about the treatment of diseases of the catarrhal affections of the upper air-passages conupper air-passages our machinery was very extensive; sists in the treatment of the nasal passages—which but now that we finally obtain striking success in the involves the restoration of these passages to a management of these diseases he thinks he may normal condition by the removal of obstructing safely say that all the machinery necessary might be bone and cartilage, reducing hypertrophied memcarried in a small hand-satchel. As regards topical brane, and correcting hyperæmia or other morbid applications to the larynx, in the early days of conditions. It consists in use of the snare, the saw, laryngology, did any of them, asks Dr. Bosworth, the knife and the cautery. And of these Dr. Bosever do any good? In his opinion, in the whole worth prefers the cautery. history of laryngology no case of so called chronic laryngitis was ever cured by topical applications; somewhat different from those just mentioned. In and as regards the more serious affections no one regard to the doubt as to the efficacy of our methods ever claimed that topical applications could cure of treating these affections, this does not exist for them. "The condition called chronic laryngitis is Dr. Smith as regards acute and subacute affections. merely symptomatic and secondary to disease of the In chronic cases he holds that surgical treatment nasal cavities in every case. The morbid condition cannot take the place of local treatment, " and that, is not an hyperæmia with hypersecretion, to be cor- when surgery has done all that it can do, there still rected by an astringent, but rather a perversion of remain nearly three-fourths of the chronic throat and the normal secretion of the part, due to the morbid nose cases for the treatment of which we are lesion above." He takes the view that there is no dependent mostly upon medicaments applied to

such condition as naso pharyngeal catarrh in the sense of its being a catarrhal inflammation of the vault of the pharynx. "This disease, which is supposed to consist essentially in an excessive secretion from the vault of the pharynx, due to chronic inflammation of its lining membrane, is a myth. This excessive secretion is in reality diminished secretion. It is a normal secretion from a healthy membrane, but undergoing subsequent change as a result of disease in the part above." Astringents are not indicated here, but some method which reaches the cause or course of the disease, which is situated in the nasal cavities.

In such conditions in the vault of the pharynx as hypertrophy of the pharyngeal tonsil, acute or chronic inflammation, neoplasms, or other diseased conditions consisting in structural changes the indications are for surgical treatment; local agents have no other than a palliative effect. Nor is nasal THERAPEUTICS OF THE UPPER AIR-PASSAGES. catarrh a hypersecretion, to be cured by the applica-How far are the topical measures at present em- tion of astringents; at least it may be said that even the nose."

From his point of view, then, the treatment of

The views taken by Dr. Andrew H. Smith are

the diseased surfaces." Dr. Smith's statistics are formations, which must be treated surgically. It taken from the report of a large throat clinic, in may be safely said, he thinks, that as pus can be which it is seen that of 1351 cases 370 operations prevented only by excluding germs, so all chronic were performed. But it is not very probable that mucous inflammations can be got rid of only by extwo or three times this number should have been op-cluding the presence or preventing the activity of erated upon? Is not much of the difficulty met germs. This possibly may be done by improving with in treating these cases unsuccessfully due to the resisting power of the tissues, and by using the non-interference (surgically)? "Under the most disinfectants directly; remembering in regard to the favorable circumstances," says Dr. Smith, all we can latter point, that pure ocean or mountain air is the do toward promoting the resolution of an inflamma-best disinfectant, and disinfectants of the earbolic tion is to assist the reparative efforts of nature." acid class probably next best, except for necrotic But how much, if any, reparative effort is nature affections, in which the chlorine class is better making in these cases?

Dr. Thomson begins his paper with the statement that in his opinion, "the treatment of chronic diseases of the upper air-passages should be directed chiefly by two principles: first, by taking cognizance of cutaneous nerve associations in the causation and in the perpetuation of inflammations of mucous membranes; and, second, local disinfection. We know that many persons with chronic mucous catarrhs are affected by external influences which are entirely inappreciable by persons in health, and can detect a draught of air, as from a keyhole, which would be unnoticed by a healthy person. For this weakness, or irritability vaso-motor tonics are needed, and Dr. Thomson knows of nothing which will compare with the local application of the cold. The cold douche to the nape of the neck on rising, care being taken that the hair of the back of the head is not even dampened by the water, and cold salt-water sponging of the throat, according to him, are measures which should be kept up for months together, in all affections of the upper air-passages. But why take care not to dampen the hair? Wash ing the hair every morning is a measure of cleanliness; why do away with it? When reaction from the douche is established, he says, and the skin is dried, the entire surface of the front and back of the neck and of the root of the neck, and then of the back of the shoulders, ought to be well rubbed with sweet olive oil, to lessen the tendency to perspiration, or at least to check the chilling effects of rapid evaporation of the perspiration. The sensitive surface must then be protected by special coveringthe patient should even sleep in woolen night shirts and between woolen sheets. During the day a perforated buckskin shirt should be worn over the light woolen undergarment.

Thomson looks for the greatest progress in the henceforth know that "We have an upper and a treatment of diseases of the upper air-passages, ex- lower skin. The lower skin moves all the time, and cept, of course, in those cases dependent upon mal- the upper skin moves when we do." We must admit

PHYSIOLOGY FOR CHILDREN.

In the Century for April is an article on "English as She is Taught," by that man of humor and good common sense, Mark Twain. It consists mainly of answers to questions put to pupils in public schools, and gives a very good idea of the mental training received by children in obtaining what is called "an education." It shows, in other words, the folly of filling the minds of children with fragments of subjects which they cannot understand.

Amusing as is the article, it would be more so did it not have the sad side-did it not show how much growth-force, how much brain and nerve force, how much physical strength, are actually wasted to no purpose, and dwarfed. And while reading it we are constantly reminded that adults, "children of a larger growth," are but too often carried on in the same stream, into which they are thrown in childhood, to a ripe age of miseducation. It clearly shows the truth of what has been so often said: the child, or the pupil, must first be made to see, and then to understand what he sees. Space will not permit us to notice more of the article than that containing the answers to the questions on physiology; and from these answers we can readily imagine how the subject was taught-very much as it seems that chemistry (and physiology) is taught in many academic and medical schools.

The first answer, while not sufficiently comprehensive, is fully as clear as some that we have seen: "Physillogigy is to study about your bones stummick and vertebry." The next shows that hygiene is receiving no little attention in the schools: "Occupations which are injurious to health are carbolic acid It is in the direction of local disinfection that Dr. gas which is impure blood." Dermatologists must that the child was not far from the truth who said it is at once heralded as a grand achievement. It is that "The body is mostly composed of water and so important that it cannot wait for the slow circulaabout one-half is avaricious tissue." Old as is the tion of the medical press, but quickly reaches the science of human anatomy we are constantly learn- profession and the public simultaneously through the ing something new; it has remained for an American daily secular press and telegraph. PROFESSOR ZIEMSSEN'S LECTURES.—The lecture has elapsed to make permanent results possible, and arrangements by which we will publish them from advanced sheets. Among others the lectures will include the following subjects: "Subcutaneous Bloodinjections, Saltwater infusion and Intra-venous Transfusion;" "Cholera and its Treatment;" "Treatment of Typhoid Fever;" "Diphtheritic Paralyses and their Treatment;" and on diseases of the respiratory, circulatory, digestive, uro-genital and muscular ap-

Professor Senn's Letters.—In this issue of The JOURNAL appears the third of a series of letters from Dr. N. Senn to Dr. Christian Fenger. It may be safely said that no such review of foreign surgical phia Hospital in the use of Bergeon's treatment of work has ever appeared in this country as is being given in these letters, and that few men are so admirably fitted for writing up the subject as Dr. Senn. His tour includes England, France, Spain, Italy, and Germany, including the Congress of German Surgeons, recently held in Berlin. It is with pleasure that we acknowledge our indebtedness to Drs. Senn and Fenger for permission to publish these interesting and valuable letters. The letters will appear regularly.

SOCIETY PROCEEDINGS.

CHICAGO MEDICAL SOCIETY.

Stated Meeting, April 18, 1887. THE PRESIDENT, W. T. BELFIELD, M.D., IN THE CHAIR.

PRELIMINARY DISCUSSION ON THE TREATMENT OF PULMONARY AFFECTION BY GASEOUS ENEMATA, WITH EXHIBITION OF APPARATUS.

THE PRESIDENT: During the last twenty-five years various specifics for pulmonary tuberculosis have been announced by enthusiastic physicians and have successively secured more or less attention from the profession, yet none of these has secured in the hands of others the results claimed by its discoverer. The benzoate of sodium treatment of Rokitansky accomplished nothing in other hands; the phenic acid injections of Déclat were powerless to arrest the disease in any but his own hands; the eucalyptol treatment of Roussel failed in the hands sion. She has gained over nine pounds of flesh, of other investigators. The latest method of treat-expectoration has ceased, sweats abolished. The ment—that recommended by Bergeon, of Lyons, after two years' careful observation—has, unlike its predecessors, met with almost unanimous approval of arrest, the bacilli of tuberculosis being still recogat the hands of those who have tried it, including physicians in the Paris and Philadelphia hospitals and several practitioners in our own city. Since the râles, dultiess of percussion, harsh breathing, deficimethod not only promises well, but is also universeent expansion over right upper lobe, and tubercle ally accessible to the profession, it has been deemed bacilli in sputa, have recently been placed under the advisable to present the subject to the members of treatment. In these cases the gain in one week has the Society in a preliminary discussion this evening. been most material. The râles have disappeared

There will be presented communications from Bergeon, of Lyons, Bruen, of Philadelphia, as well as the experience of several gentlemen who have used the method in this city.

Dr. Francis I. Crane read a paper entitled BERGEON'S METHOD OF TREATING PHTHISIS BY GASEOUS ENEMATA.

(See page 541).

THE PRESIDENT: This method of Bergeon has been extensively used in the Philadelphia Hospital, chiefly by Dr. Bruen, who has kindly sent the following résumé of his experience with it:

The experience thus far obtained in the Philadelconsumption by rectal injections of carbonic acid gas impregnated with sulphuretted hydrogen, has been

highly encouraging.

In the Medical News, of April 2, 1887, a statement of clinical results thus far secured in my wards, was presented. These results indicated that the element of suppuration in pulmonary phthisis was usually very positively influenced. The night sweats have been controlled in twenty five cases without an exception. The temperature has been modified even in the most advanced eases, and in some instances in which the disease has been extensive it has been brought to a normal point. A peculiarity of the temperature charts seems to be an introduction of a sub normal temperature in the forenoon. The expectoration has been lessened in all instances, and in some has disappeared. A marked impression has been made for the better on the nervous symptoms which attend the disease, and a more cheerful and sanguine spirit has followed the therapeusis.

It would seem justifiable to conclude that we have a most important therapeutic agent in the gas enemata treatment. One ease of acute broncho pneumonia treated on this plan has recovered, and will be discharged from the hospital. The history of her case has been already stated in the article in the Medical Another case of phthisis with pneumo thorax under treatment for five weeks, is so much improved that the patient insists on her discharge. The râles have disappeared from this patient's chest (the pneumo thorax was local and confined to the lower zone of the right thorax), the opening into the lung has apparently closed and retraction of the chest wall is going on. This patient had been ill for a year previous to admission to the Philadelphia Hospital; the pneumo thorax was noted on admiscough, however, continues as a modified symptom, since she is as yet merely a case of phthisis in stage nizable in the sputa.

Two cases of commencing phthisis with moist

and the patients express themselves as benefited, cases which cannot tolerate the treatment at all, The method of treatment is surely worth a careful One patient who had hiemorrhoids suffered from scientific investigation.

sodium and 5 grs. chloride of sodium in 22 ounces to be abandoned in the course of a month, although of water has proven the most satisfactory substance superintended by Bergeon himself. I was asked to to produce the sulphuretted hydrogen. A solution administer the treatment in a case in which the lungs more strongly impregnated with sulphuretted hydro—were so extensively destroyed that it seemed to me gen has not only been more advantageous, but unwise to administer it, though perhaps a small seemed injurious, apparently inducing palor, loss of amount of gas might have ameliorated the sympappetite, and in some cases, irritation of the bowels. toms; but had it been possible to abate or arrest the The gas should be introduced slowly, not less than disease, the patient could certainly not have lived half an hour scems requisite for each scance. From with such a small amount of lung left. Of course three to five quarts can be introduced in most cases, this consideration is one which renders the indisa gain in the tolerance of the necessary distension criminate use of the treatment hazardous. There of the bowel being rapidly acquired. The absorp- are cases in which the recovery, or arrest of the distion of the gas from the bowel is very rapid and in ease has been so complete that the patients are half an hour the distension will entirely subside. It practically well, and have been able to return to is sometimes introduced more rapidly, but the gain their advocations. However, if we are to estimate is in proportion to the time consumed in giving the this thing by the disappearance of bacilli from the gas. The carbonic acid can be pumped through the sputum we must say it is not a cure. No case is resolution containing the sulphuretted hydrogen by ported in which bacilli have entirely disappeared, the acid of a ball with valve attachment, and a circu- As you know, M. remedy is rather limited, but it seems to me there fall received injections of phenic acid twice daily, are several questions which should be considered in without any improvement, who had been taking speaking on this subject: First, is the treatment cabinet treatments from me for six weeks, without safe? Second, is it applicable in all cases? Third, improvement, in whom the right lung is extensively is it a cure? I have already answered these quest consolidated, with a large cavity; in this case the tions in an article in The JOURNAL which appeared relief for the first week was certainly very surprising. last Saturday (April 16). Practically the treatment The patient gained in strength and experienced a is safe under the precautions which are laid down, feeling of well being, or as she expressed it a clearer but Dr. Osler in some remarks before the Philadel-feeling in her head, a feeling of brightness which she phia County Medical Society, narrates a case in had not had for weeks. She certainly coughed less which the patient almost succumbed after the first and expectorated less at a time. Her stools had treatment, the gas being charged with a mixture of been clay colored in spite of everything I could do; bi sulphide of carbon and sulphuret of hydrogen, at the end of a week they were of a natural color. We can also conceive of cases in which, on account. The movement of the bowels was perfectly natural, of limited respiratory power, the rapid administration her tongue also cleaned off in a remarkable manner of the gas by producing distension of the large bowel, at the end of five days. The treatments were conwould seriously embarrass the limited respiratory tinued at my office twice a day, and the patient had capacity remaining in the patient. It is also con- to come into the city so the improvement was perceivable that an undue amount of distension in haps not quite as great as if she had taken the treat-cases of tubercular ulceration of the bowel might be ment as home. The second week she did not do dangerous, possibly producing rupture and peri-quite as well which I attributed to the quality of the tonitis; and it seems to me this is a consideration mineral water. At the end of two weeks she was which would render us cautious about administering improved in respect to all the symptoms which have this treatment in typhoid fever. I have had no ex-been related this evening. The night sweats had perience and seen no reports of cases of this disease | ceased, her temperature was lower, but not normaltreated in this way. In regard to its applicability in it ranged from 99° to 1005°. I took her temperaall cases; that has been partially answered in consid-ture at 9, 11, 2 and late in the afternoon, and the ering the previous question. It has been the exhighest she had with the exception of once was perience of Geneva physicians, as reported by M. 1004, it was repeatedly 985. Her tongue did not Wiss, and of De La Roche, of Lyons, that there are remain clean, and her appetite did not improve as I

such colic that the treatment had to be abandoned. In our hands a solution of 5 grs. sulphide of Wiss also mentions a case which the treatment has dication is placed to register the flow of carbonic much interest. French physicians are experimenting

I am now using the treatment upon two cases, We have not obtained as yet satisfactory results one is bronchitic asthma, but the treatments are too is due to the treatment or is merely a coincidence. Another case is a lady aged 34, who has been suffer-Dr. R. H. Barcock: My experience with this ing from phthisis for a year and a half, and who last plication, tubercular laryngitis, quicker than she which gives about the proper amount of sulphuretted would otherwise have done. M. Bergeon states de-hydrogen gas, at least the patients all say that they cidedly that tubercular laryngitis has been very feel better and have no unpleasant symptoms. I greatly improved by this treatment. In the case have given it in three other cases, one has some just mentioned the laryngeal symptoms have im pelvic trouble, and the physician who is treating her proved, but whether entirely due to the treatment I thinks that might be a counter-indication to the am not prepared to say, as she has had various remedy, but she seems to be better in her general sprays and one topical treatment to the larynx. Her condition, has increased in flesh, and coughs less and case is somewhat discouraging owing to the extent prefers to continue the treatment. Another case of of the disease since it is not entirely confined to the incipient tuberculosis, where the upper left apex is right lung. She has complained of no unpleasant affected more particularly, seems to be improved symptoms since the first treatment when she complained of a slight burning at the anus and a desire the treatment one week. to evacuate the rectum. Once or twice she complained of a little colic. She is now taking the treatment of phthisis I saw the difficulties that were treatments at home and feels very much encouraged, but the outlook to me is not what it should be. I saw her last Thursday, and I felt disappointed to The apparatus presented to-night is not portable, learn that she is beginning to perspire again.

this case thus far, and it proves that the treatment patient or else one must run the risk of breaking the does not give rapid improvement in all cases, and apparatus. In the first place, I thought of a method and the fact cited by Wiss, that out of four cases of collecting the carbonic acid gas, by taking one of treated in Geneva all died within three months, those portable laughing-gas cylinders, to be obtained shows that it does not cure in all cases. However, at any dental depot, to a soda-water fountain and it is a treatment which is so admirable and furnishes having it charged with carbonic acid gas. There can such good results in many cases, that I think all be stored from one to 500 gallons of gas, equally physicians are justified in trying it. Another thing chemically pure with that recommended. This apwhich recommends it is that after the patient be-paratus would simply require the turning of a stopcomes accustomed to the treatment it can be handed cock in the tube or opening to permit the gas to over to a trusty member of the family to administer, escape at any rate desired. If found desirable to Compared with pneumatic differentiation it offers a continue the use of sulphuretted water, instead of much better chance for the improvement of the pa tient, although there are cases in which pneumatic by using a wash bottle and a delivery tube. I believe differentiation will do what this will not. But thus an equally efficient method is to introduce into this far this method gives better prospects of benefiting cylinder a solution of sulphide of potassium, which a number of cases than any method which has been furnishes for every ounce of the sulphide of potassium

Alexander Ogston—Osteotomy for Pes Planum-Antisepsis in the Aberdeen Hospital—Lumbar Abscess—Fungous Osteo-myelitis of Femur—Dr. Keith His Method of Operating—Treatment of the Pedicle—Suturing the Abdominal Wall.

Dear Dr. Fenger:—One of the principal objects of my tour through Scotland was to see in the flesh the man whose name I had so repeatedly mentioned to my class, the discoverer of the pus-microbes, Professor Alexander Ogston, of Aberdeen. While the scientific world knows but little of Aberdeen, its Hospital and its University, the name of Ogston has penetrated to all parts of the civilized world. Dr. Ogston is a man in the prime of life, tall, and handsome. Although a profound scholar, an able surgeon, and a splendid writer, he is one of the most modest men I have ever met; a good illustration that greatness is not incompatible with modesty, but rather the reverse. In my conversation with him I could not but draw a comparison between him and the average doctor in a Medical Society, who is full of experience and crammed with positive assertions. Although living in a comparatively small city, Dr. Ogston's life is an exceedingly busy one. He holds the Chair of Surgery in Marshall College, where he teaches the various branches of surgery, including otology, ophthalmology, and gynacology; at the same time he attends to the clinical work in the Infirmary, and a large private practice. I visited with him the Royal Infirmary, a building more than fifty years old, with 300 beds, nearly one-half of which are occupied by surgical patients. Although the sanitary condition of the Infirmary is quite defective, all wounds showed that even under unfavorable cir-

Another case was a young man of scrofulous habit, cumstances good results can be obtained by strict

One of Ogston's operations, osteotomy for pes with the base of the wedge directed downwards, so that when the osseons surfaces are brought into apposition the arch of the foot is restored. Coaptation and fixation is secured with two disinfected bonenails and a plaster of Paris dressing. In all aseptic wounds the bone-nails disappear by absorption. He has done the operation forty times, and has never observed any serious results; and in only one case the deformity returned, and was permanently corrected by a second operation. He does not resort to this operation indiscriminately in every case of flat-foot, but only in such cases which do not yield to simpler measures, such as rest and fixation. About three months are required for firm bony union to take place, and he insists that the patients should not be allowed to step upon the foot before this has taken place, otherwise a return of the deformity would be inevitable.

An excellent proof of the care which is exercised in this old hospital in preventing wound infection, is the fact that all abdominal sections performed by Dr. Ogston and his colleagues, some thirty in number, recovered. For disinfection of the hands and field of operation the surface is washed with soap and warm water, and rubbed with a piece of pumice stone, after which it is washed with spirits of turpentine, and lastly with a five per cent, solution of carbolic acid. The instruments are treated with turpentine, washed with carbolized solution, and immersed in a five per cent, solution of carbolic acid. Dr. Ogston does not hesitate to walk from the dissecting room or after a course of operations upon the cadaver, directly into the operating room and perform any operation, and has never observed any ill results of such a course when the hands are thoroughly disinfected.

I witnessed two operations in his clinic. The first was for an abscess, which had evidently commenced in the lumbar region and had gravitated below Poupart's ligament. He prefers, in all these cases, to make a free incision just above the iliac crest, and drain the abscess from this point. He also called special attention to this method of operation, as it enabled the surgeon to seek for the cause of the suppuration in the lumbar region and the iliac fossa, and to remove the primary cause through the same incision should circumstances dictate such a course. He has never observed a ventral hernia after this operation.

The second case was one of fungous osteo-myelitis of the lower end of the femur, which had been operated upon some years ago, but the pain had recently returned. The femur was opened on the outer surface with the chisel, by removing quite a large piece of the compact layer. The interior was gouged out thoroughly, and after thorough cleansing and disinfection the cavity was allowed to fill with blood, after removing Esmarch's constrictor, and an

DOMESTIC CORRESPONDENCE

"RECTAL SURGERY MADE EASY."

exposed the "systems" of rectal surgery practised by a future time to show how the peculiar banded arnumerous Western itinerants and charlatans. In that rangement and loose submucous connections of the article I referred to the little rectal "pockets and thin mucous membrane of the part tend to deceive fringes" or "pockets and papillæ," described by the unwary examiner. various standard authors, and well known to anatomists as existing at the base of the columns of Morgagni, just above the verge of the anus. A writer of certain lectures and essays on the subject had claimed these as being mainly his own discovery, and urged that they were "lesions," and fearfully bad ones at that; in short, that they should always be snipped out troversy that seems to be raging between several of when found. I maintained, on the other hand, that these minute organs were natural, and composed dosage, but a statement made by Dr. Martin in his of healthy mucous membrane and connective tissue. I remarked, however, that, like other organs of the Uterus by Electrolysis," which appeared in your body, they sometimes became diseased and required issue of April 23, is so remarkable as to call for corsurgical attention, but were not themselves diseases rection in the mere interest of humanity. requiring to be split and snipped in ordinary cases.

ting such occasional disease and need of surgical at- batteries of sufficient electromotive pressure, and tention, I concede all that the author of the essays should some physician while using them put Dr. claims. The editor of the Monthly is mistaken as to Martin's directions about dosage in practice, the rewhat had been promulgated. The writer of the essult would be most disastrous to the patient. The say on "Pockets and Fringes," or "Pockets and Pap | particular statements referred to, which appear also illee," as he elsewhere calls them, has shown no dis- in Dr. Martin's letter in the same issue, are those in position to hide himself or his ideas in a corner. He which he claims to have applied currents varying has expressed himself fully on every possible occa- from 250 to 1000 milliampères without unfavorable sion, and loudly makes the following claims:

1. That, as to these "pockets and papillæ," "no mention of them can be found in current literature; though they are described in various works, both old meter in his paper, which he states to be correct and and new.

2. That these little natural irregularities are "lesions," of the most fearful, health-destroying power.

3. That "they always occasion a spasmodic contraction of the splaneter ani."

4. That "their removal is invariably attended by improvement;" though many patients have got worse instead of better under the treatment.

5. He says: "I am now, as I was two years ago, in favor of removing these rectal pockets under all circumstances, and in all cases in which they are found."

6. He remarks: "Hook upon these conditions as

7. He emphasizes with italics the following: all pathological conditions, surgical or medical, which from the delicate derangements of brain substance that produce insanity, and the various forms of neurasthefound in the courser structures of the body, there will etc., do more or less injury, the principal part of all the above-mentioned obstinate diseases of every part of the body are caused by the "pockets and papillae" of the rectum, and that the snipping of them out is "invariably attended by more or less improvement." Were good old Hahnemann alive, this etiology of one of his followers would make his hair stand on end.

The writer has made some special rectal dissec-Dear Sir:—In a former article in The JOURNAL I tions in this connection, and may have occasion at

GALVANIC DOSAGE.

Dear Sir:- I have no wish to enter into the conyour correspondents on the subject of galvanic article on the "Treatment of Fibroid Tumors of the

Really strong currents are now becoming possible The Peoria Medical Monthly avers that, by admit- by the use of direct dynamo circuits or of secondary results, and even as much as 10 ampères (10,000 milliampères) without giving excessive pain. Since Dr. Martin takes occasion to describe a milliampère evidently uses himself, the extrordinary nature of these claims remained a mystery until the last paragraph of the third section of his paper (page 450) was scanned. He there states that his 1000 ma. were obtained from a battery of 115 gravity cells. Such a thing is utterly impossible, for these cells present an internal resistance of at least 10 ohms apiece —more often 13 to 15 ohms. Placing it at 10 ohms, the total internal resistance of the battery of 115 gravity cells would be 1150 ohms, and with the electromotive pressure of each cell taken as one volt (which is rather high) the greatest amount of current

obtainable from the battery with the metallic poles brought directly together will be shown by the following calculation: 115 volts divided by 1150 ohms equals 0.1 ampère or 100 ma. But as soon as his patient is inserted in the circuit even this amount of current becomes impossible. If one electrode is large and one applied beneath the skin by puncture, the resistance of the body may possibly add only about 850 ohms to the circuit, making a total of 2000 ohms. This changes the results to the following: 115 volts÷2000 ohms=0.0575 ampère or 57 milliampères. This calculation is a simple application of the most rudimental law in electrophysics, and it is but just to suppose that the gentleman making the important blunder pointed out had forgotten about his battery resistance and its effect upon his figures, although the mistaking of 50 milliampères for 1000 is a trifle startling. But even the 40 or 50 ma. really used by Dr. Martin are strong doses when applied to the delicate lining membrane of the uterus or concentrated at a single point within the tissues, and it would seem that some words of caution might be added to both his and Apostoli's commendation of these methods respecting the dangers as well as advantages of such vigorous electrolysis. In my own practice 10 to 15 ma. have been generally sufficient.

Very respectfully yours,

G. Betton Massey, M.D.

1706 Walnut St., Philadelphia, May 2, 1887.

ASSOCIATION ITEMS.

AMERICAN MEDICAL ASSOCIATION.

The Thirty eighth Annual Session will be held in Chicago, Ill., commencing on Tuesday, June 7, at 11 A.M., in Central Music Hall, corner of State and Randolph streets, and will continue four days. Good rooms for the several Sections will be provided as near the hall for general meetings as possible. Registration books will be open in Central Music Hall on Monday, the day preceding the meeting, for those who wish to register early.

In addition to the list of papers for the Sections published last week the following subjects are an-

nounced:

Section on Practice of Medicine.

C. H. Hughes, St. Louis, Mo., will present a "Unique Case of Athetosis resulting from Railway Shock." F. C. Schaefer, Chicago, will present a case of "Complete Loss of Scalp, including the greater portion of the Eyelids and one Ear. Treatment by Skin-Grafts. New Scalp.

Section on Surgery and Anatomy.

Edmund Andrews, Chicago, Ill., "On the Solution of Necrosed Bone in Spinal Abscess by Dilute Hydrochloric Acid."

Geo. E. Stubbs, Philadelphia, Pa., "Wound Dressing - Some Notions Accepted, and some under Discussion.

Section on Ophthalmology, Otology and Laryngology.

J. W. Wright, Columbus, Ohio, "Evulsion as a Means for the Radical Removal and Cure of Pterygium;" G. C. Savage, Nashville, Tenn., "The Function of the Oblique Muscles in Certain Cases of Astigmatism;" Edward Jackson, Philadelphia, Pa., "The Effects of Obliquity of the Correcting Lens to the Visual Axis, with practical deductions; also "A New Form of Facial Frame;" Seth S. Bishop, Chicago, "Treatment of Hay Fever;" "Treatment of Chronic Suppurative Inflammation of the Middle Ear."

Section on Medical Jurisprudence.

Joseph Jones, New Orleans, La., "A Claim to Priority in the Determination of the Chemical and Microscopical Characters and Changes of the Blood in the various forms of Malarial Paroxysmal Fever, and the application of the results of their investigations to Medical Diagnosis and Medical Jurisprudence;" Marshall D. Ewell, Chicago, Ill., "Micrometric Measurements, as applied to the measurement of Blood Corpuscles in Medico-Legal Cases;" John Godfrey, U. S. Marine Hospital Service, Louisville, Ky., "Expert Testimony;" H. M. Bannister, Eastern Illinois Hospital for the Insane, Kankakee, Ill., "The Criminal Responsibility of Epileptics;" Rev. Louis Theband Jones, Moweaqua, Ill., "The Intimacy of the Medical and Clerical Professions, with the Supremacy of the Former in the Sociological Sense, at Least;" H. C. B. Alexander, Chicago, Ill., "Forensic Relations of the Puerperal State;" John V. Shoemaker, Philadelphia, Pa., subject not stated.

Section on Obstetrics and Diseases of Women.

W. W. Potter, Buffalo, N. Y., "A case of Pyosalpinx - Cure without Operation;" C. R. Reed, Middleport, O., "Case of Tubal Pregnancy, with Specimen of the Anomaly;" Joseph Eastman, Indianapolis, Ind., "Uterine Subinvolution and Areolar Hyperplasia.

RAILWAY RATES.

The following named roads will give reduced fares to all delegates, members, and their families attending the meeting. turn tickets will be issued on the certificate plan only. for the return journey will be sold at 1/3 the highest regular limited fare. If there is no limited fare to a desired point, the price will be 1/3 the unlimited fare. Tickets for the return journal. ney will be limited to continuous passage by first train after they are bought. All tickets for return journey must be accompanied by a certificate signed by the Chairman of the Committee on Transportation, or by an authorized member of the Committee, showing that the holder has attended the meeting. are good for to days from date of purchase.

MISCELLANEOUS.

THE AMERICAN CLIMATOLOGICAL ASSOCIATION will hold its next annual meeting in Baltimore, May 31 and June 1, 1887, immediately preceding the days for the meeting of "The Association of American Physicians' in Washington, D. C. The Secretary is J. B. Walker, M.D., 1617 Green street, Philadelphia, Pa.

Dr. Oscar C. De Wolf, the efficient Health April 28, 1887.

Officer of this City, has been reappointed by Mayor Major J. V. D. Middleton, Surgeon; Major J. C. G. Happer-Dr. Oscar C. De Wolf, the efficient Health

A Public Health Conference will be held in Louisville, Ky., on May 24 and 25, under the auspices of the State Board of Health.

REGULATION OF PRACTICE IN MICHIGAN.—A bill to regulate the practice of medicine in Michigan has just passed the lower House of the Legislature.

THE MEDICAL SOCIETY OF THE STATE OF CALI-FORNIA met in its seventeenth annual session in San Francisco, April 20, 1887. The following were chosen officers for the ensuing year:

President—R. H. Plummer.

First Vice-President-A. H. Agard.

Second Vice-President—David Powell.

Third Vice-President—H. N. Rucker.

Fourth Vice-President—L. M. F. Wanzer. First Assistant Secretary—J. H. Parkinson.

Second Assistant Secretary—G. W. Davis.

Treasurer—G. C. Simmons.

Board of Censors—Jules Simon, W. Anderson, J. D. Arnold, I. E. Oatman, C. G. Kenyon.

Board of Examiners—C. E. Blake, W. Lawlor, Jules Simon, C. H. Steele, T. J. Le Tourneux, C. E. Farnum, A. 11. Pratt.

Alternates-H. H. Hart, C. C. Wadsworth, A. P.

The Committee on Appropriation for the Ninth Devan, S. E., P. A. Surgeon, granted leave of absence for International Congress, recommended that \$100 be donated. Adopted.

Regulation of Medical Practice.—The following resolution was adopted: "That it is the sense of this Society that the best interests of the public and the medical profession will be better subserved by one State Board of Examiners rather than more; and by examination of applicants rather than of diplomas;

and that there should be proper provisions made for expenses of such Board.'

Vaccination.—The following resolution was adopted: That it is the sense of the members of the California State Medical Society, in convention assembled at San Francisco, at its regular annual session, that vaccination should be made compulsory, and that the State Legislature should be urged to enact such laws as shall result in the protection of the entire population from small-pox.

[We are indebted to the Sacramento Medical

Times for advance sheets of this report.]

OFFICIAL LIST OF CHANGES IN THE STATIONS AND DUTIES OF OFFICERS SERVING IN THE MEDICAL DEPARTMENT, U. S. ARMY, FROM APRIL 30, 1887, TO MAY 6, 1887.

Major Blencowe E. Fryer, Surgeon, ordered for examination by Army Retiring Board, at San Francisco, Cal. S. O. 101, A. G. O., May 2, 1887.

Major George M. Sternberg, Surgeon, assigned by the President to the special duty, under the Treasury Department, of "investigating the merits of the method practised in Mexico and Brazil for preventing yellow fever by inoculation." Relieved from duty as attending surgeon and examiner of recruits in Baltimore, Md. S. O. 101, A. G.O., May 2, 1887.

Major John S. Billings, Surgeon, granted leave of absence for ten days, to take effect May 3, 1887. S. O. 98, A. G. O.,

sett, Surgeon; Çapt. F. C. Ainsworth, Asst. Surgeon, appointed to assemble at U. S. Military Academy, West Point, N. Y., on June 1, to examine into the physical qualifications of the members of the graduating class and of the candidates for admission to the Academy. S. O. 102, A. G. O., May 3, 1887.

Capt. Leonard Y. Loring, Asst. Surgeon, sick leave of absence still further extended six months, on surgeon's certificate of

disability. S. O. 103, A. G. O , May 4, 1887. Capt. Victor Biart, Asst. Surgeon, sick leave of absence still further extended one year, on surgeon's certificate of disability. S. O. 99, A. G. O., April 29, 1887.

First Lieut, Chas. B. Ewing, Asst. Surgeon, ordered from Ft. Leavenworth, Kan., to Ft. Lewis, Col., for temporary duty. S. O. 100, A. G. O., April 30, 1887.

FICIAL LIST OF CHANGES IN THE MEDICAL CORPS OF THE U. S. NAVY, DURING THE WEEK ENDING MAY 7, 1887. OFFICIAL

Shafer, Joseph, Asst. Surgeon, detached from the "Minnesota," and to the "Ossipee."
Simon, W. J., Surgeon, ordered to the U. S. Str. "Boston."

Henry, C. P., Asst. Surgeon, detached from hospital, Phila-

delphia, and to the "Boston."

Means, Victor C. B., Asst. Surgeon, detached from hospital, Mare Island, and to the hospital, New York.

Simons, Manly H., P. A. Surgeon, detached from Naval Academy, and to the "Constellation." Diehl, Oliver, P. A. Surgeon, detached from hospital, New

Vork, and to the hospital at Philadelphia.

I recall the matic symptoms were pytemic in nature, or that the case both from conversations and letters concerning cardiac lesions supervened secondarily to the ganit at the time. Unfortunately, the notes of the case grene. The teachings of the autopsy do not sustain in Dr. Musser's possession have been mislaid. His either supposition. The absence of old cardiac memory and memoranda in his case-book feebly and vascular lesions, and the general integrity of the supply the deficiency; fortunately we have the organs, preclude the possibility of pyemia. The normal condition of the arteries (absence of athe-Case 1 .- Rheumatism; embolism of large vessels; roma), the absence of primary blood dyscrasiae, or cardiac murmurs; gangrene; chills and fever; death. of any cause, save cardiac, for the emboli, defeat the

Case 2.—Malignant endocarditis; chills, irregular patient had been ill about six weeks, of an irregular August 1. Sudden severe pain occurred in the fever, also said to be malarial. At this time she was

habits.

The family history of the patient is very good. Her parents and several brothers and sisters are living. One sister died of pneumonia; the cause of death of another is unknown. On admission it was noted that the patient was prostrated and complained of chilly sensations, she sweated profusely, and suffered from nausea. The tongue was clean and moist; the bowels loose, five movements in twentyfour hours, thin and greenish in color; the nausea edema. Mind clear. had disappeared in twelve hours; tenderness of the epigastrium was observed, but none in the iliae extends from the left edge of the sternum one inch fossæ. The spleen extended, in the axillary line, from the sixth rib to the margin of the ribs. There the third interspace two inches, and in the fourth was no eruption. Both cheeks were flushed. The skin and mucous membranes were pale, the hands quite anæmic. She was somewhat emaciated. The mind was clear. The lungs and heart were normal; the latter rapid in action, and rather feeble. Milk diet, stimulants, and quinia ordered.

September 2. My resident, Dr. Dorland, detected a eardiae murmur two days ago, and to day the following is noted: General symptoms and appearances about the same. Apex beat of heart in fifth interspace in nipple line; impulse moderately feeble; no thrill; pulmonary second sound accentuated; highpitched systolic murmur at apex transmitted to axilla; no murmur at aortie orifiee. Pulse rapid, small, and feeble. No cough; no dyspnæa. Ulcer-

ative endocarditis suspected.

8th. The fever has continued in spite of quinine. The patient sweats profusely throughout the day, but not at night. Her anæmie appearance is striking. She is quite cheerful, but is evidently losing flesh and strength. The diarrheea continues. The cardiac murmur has increased in intensity during the past forty-eight hours, and can be heard loudly at the angle of both scapulæ, louder at the right. Marked tenderness on pressure, and some pain complained of in the third left intercostal space. At the base of the right lung impaired resonance, and fine, moist, crepitant râles are observed. A few rales are heard at the right apex also. Short, highpitched, jerking inspiration and prolonged expiration is detected at the right apex, and high-pitched inspiration at the left.

size, bright red, not disappearing on pressure. Hæmorrhages in the ocular and palpebral conjunctive of both eyes at inner and outer canthus. Rapidly los ing flesh and strength. Sweats continue. Abdolarge wavy impulse in epigastrium. Nausea and ear was not detected. vomiting recurred the past five days; fluid dark, greenish tinge. The vomiting occurs in the morning. Diarrheea continues. Spleen readily felt be-

ailment, was strong and hearty, and of temperate in second, third and fourth left interspaces. In second interspace to the left of sternum very perceptible thrill. Systolic murmur not so loud as it has been at apex. Over third rib, left auriele loud, booming systole, with "grinding" murmur. In second interspace to the left of the sternum loud, rough, high-pitched murmur. Pulmonary second sound muffled. Murmur over tricuspid not so distinet as at mitral, and probably transmitted; aortic murmur low in pitch, conducted from base. No

13th. Physical signs as above. Cardiac dulness to the left in the second interspace. It extends in three inches. Apex beat in nipple line. Intensity of murmur greatest in second interspace. Chill this morning. Urine scanty and high-colored, and contains blood and epithelial tube casts in abundance, and a small amount of albumin. General symptoms Extreme prostration. the same.

14th. Chill at 7 A.M. A little more drowsy than formerly; no delirium. Murmur in second interspace not so distinct. New capillary infarcts in abundance about the neck. Vomiting and diarrhœa continue. Infarets in lips and on end of tongue. Conjunctivæ slightly ieterie. Dyspnæa severe for half an hour at 2 P.M. Partially collapsed state, with grasping and sighing; excessively rapid pulse; stimulants relieved the patient. At 11 P.M. a second attack. During the day very irritable, and latter part of day drowsy. Died at 2 A.M., September 15.

The following record indicates the daily fluctuations in temperature. The pulse record was not preserved, but from first to last it was rapid, 120 to

130 per minute.

note in this case.

FORT SILL, INDIAN TERRITORY. BY MORSE K. TAYLOR, M.D.,

MAJOR AND SURGEON, U. S. ARMY,

The prominence given to Fort Sill as an unhealthy

very erroneous impression respecting the present sanitary condition of this post. That it has been in portunity for the successful cultivation of the Anayears past very unhealthy, no one familiar with its charis Alsinastrum, as suggested for the improvement history will dispute, but that it is so now few, if any of the health of some of the posts, is not specially residents thereat will admit. And, as the writer has encouraging here; while it also invites us to look for been on this station for the last three and a half years, other causes in explanation of the large number of and charged with the supervision of its hygienic af- malarial and kindred diseases which have prevailed fairs, he may be pardoned for feeling a little sensitive here since the establishment of the post in 1869. upon this question; more especially so, since under his administration the post has become one of the station, let us consider the report briefly. From this most healthful and pleasant stations in the West, it appears that the average length of time patients Notwithstanding this, however, he would not write are under treatment at Sill is nine days, this being a the following at this time, were it not that a lesson fraction less than the average for the whole army, may be learned by a further consideration of the while there are 57 posts which exceed that number; Surgeon-General's statistics taken in connection with San Diego taking the lead with 23 days, followed by others of a later date.

commencing with July 1, 1885, and ending with June 30, 1886; corresponding with the national fiscal year. vite attention to the fact that the time included by the rate per 1,000 of non effectives from sickness and the Surgeon General's report was a part of the transi-multiply this by the number of days they are carried tion period in which the post passed from an ex- on the sick reports, we get a product which gives us tremely unhealthy condition to one of salubrity, a better idea of severity of the disorders and the loss records which show that in 1876 the rate of cases. Fort Sill had a rate of non effectives of 58 per 1,000, per 1,000 mean strength was 3.911, and in 1877 it which, multiplied by 9, the number of days they were was 3.067.

make the location more unhealthy than in the best tion shows that there were 16 posts which exceeded situations in the South, or elsewhere in regions of Sill. The first on the list is San Diego, with a loss acknowledged malarial tendencies. Along this creek there is a strip of heavy timber about one-fourth of a mile in width, but beyond this, and extending in all directions for one or two miles, are open bottom lands, all of which are well drained. At a distance of a mile or so to the northwest are the foothills of the Wichita Mountains, while elsewhere beyond the bottoms are wide rolling, high, beautiful prairies. Cache Creek rises about thirty miles to the northward, and running nearly due south, passing the post to the eastward three-fourths of a mile, emp ties into the Red River forty-five miles away. Medicine Bluff Creek, rising in the Wichita Mountains, and taking a nearly due eastern course past the post in their aggregates, which are omitted. on its northern side, discharges into the Cache within the limits of the reservation. Both are free flowing streams at ordinary stages; having dry beds, however, in many places in midsummer, in others stagnant pools, while in the rainy season they rise to the height of between lifteen and twenty feet; the Medicine Bluff becoming a turbulent mountain torrent.

From the foregoing it may be inferred that the op-

Before entering upon the sanitary history of the Stockton, Texas, with 18 days, and Bowie, Ariz., with It may be observed that it embraces the period 17 days. In the Indian Territory Forts Supply and Reno have an average of 13 and 11 days respectively.

There is, however, another method of estimating In this it differs from the sanitary reports of cities the relative healthiness of posts better than this, or and other countries. There are other stations that closely approach Sill

All the foregoing relates to the condition of Fort Sill before a sufficient time had elapsed to indicate what ultimate results might be expected from the efforts being made to improve its sanitary condition. These we will now consider:

When the writer entered upon his duties as Post Surgeon the latter part of November, 1883, the command, then consisting of four companies of infantry drainage of the post and contaminated in the highest and two troops of cavalry, was in a most demoralized degree. condition. Of the eleven officers for duty all had been sick during the two preceding months, three lected for this purpose was taken from the water barothers were absent on sick leave, and of the enlisted rels at the hospital soon after the delivery of the men the rate of cases per 1,000 of mean strength was water wagon, the barrels having previously been emp-468, exclusive of injuries, for the months of Septemtied. There was a large amount of sedimentary ber and October, according to the records. These, matters floating in it, and not until this had settled however, did not express the real state of the case. was the examination commenced. As there was quite a rivalry in the target practice of the respective commands, the men would take their having a feeal and urinous odor most nauseous, yet "shakes," then their quinine, and as soon as the fever it was but an exaggeration of what had been freabated, their turn at the rifle grounds, without going quently observed in the water barrels of the officers' on the sick report. From the representations of the quarters during the warm weather, after standing company commanders it was evident that few men twenty four hours. Under the impression that a misescaped. Some of the attacks were of great sever- take had been made, or that the water had been acity. Men would be stricken down while on parade cidentally fouled, the water delivered the next day or at guard mount and have to be assisted to their was distilled, but with the same results. Even the quarters. One of the more common symptoms was water in a moderate rise after a rain was little better. intense pain in the back of the neck and base of the No use could be made of it in the laboratory or disbrain. Said an officer, referring to this symptom in pensary. The sedimentary matters were placed his own case, that it struck him almost like an elec-under the microscope, and with the revelation of too trie shock, and was the most excruciating suffering many micro organisms to be described here. It duties with this aim before him, he determined to flowed out from the north bank of Medicine Bluff spare no effort in the accomplishment of his purpose. Creek fourteen feet below the surface of the bottom Careful investigations were commenced in every di-land and on the surface of a soft outcropping sand rection which might afford a clue to the origin of the rock, and discharged eight gallons per minute. As sickness. After examining the geology and natural a water supply it was condemned in 1877 by the environments of the post, and finding in these nothing Post Surgeon, and the following entry made on the to account for it, nor in the duties or habitations of post records respecting it: "This spring finds its the men, the water supply was next investigated. origin in surface water which drains out of a low and This came from two sources: one a shallow well somewhat marshy bottom stretching along the creek situated about midway on the west-side-of-the-bar--to-the north. This water contains various organisms, rack line, which was used largely for drinking pur- and it is believed, if not directly productive of malaposes by the men, and the other from a stagnant pool rial disorders, that it favors their development in in Medicine Bluff Creek situated about a third of a many cases who would otherwise escape." These remile from the post to the northwest. The supply marks had the effect of prejudicing the officers against from this source was obtained by driving a six mule it, notwithstanding its physical qualities were greatly team and a wagon into the middle part of it, thereby in its favor, being beautifully limpid, sweet and

In the belief that the prejudice against it was illit to the men at the barracks and to officers in their founded, the writer proceeded to make a careful back yards, at distances of nearly 100 feet from their analysis of it, and also to ascertain its probable geodwellings; and all into open barrels unprotected from logical source. The result went to show that it was the heat of the sun, the winds, or dust. As a result, one of the purest springs of water to be found in any the organic matters in the water soon underwent fer- country. That its origin was very remote, the flow mentation and rendered it still more disgusting. An being entirely unaffected by local rains or droughts,

After representing these facts to the commanding menoid ammonia, nitrites, and nitrates. Although it officer and urgently requesting a detail of men to was situated at an elevation of 50 feet above the sur-examine the locality and ascertain whether the disrounding bottom lands and 70 feet above the creek, charge could not be increased to a degree sufficient the water came to within 12 feet of the surface of for the wants of the command, his request was finally the ground; and it was but 30 feet from the barrack complied with. The detail was made in March, 1884, buildings and 250 feet from the cavalry stables. Its consisting of a corporal and four men, and turned water supply was clearly derived from the surface over to the writer. The work soon revealed the fact

that the water came through a bed of porphyry gravel man of bilious temperament, presented himself rather resting on the sand rock about eighteen inches above unceremoniously at my office on January 13, at 3:40 the creek bed; and further, by lowering the outflow P.M. A friend assisted him to stagger into the office the discharge was increased to over 7,000 gallons per and to throw himself upon a lounge. Mr. S. then hour. On reporting the results of his efforts to the informed me that he had taken poison and was dydepartment commander, the sum of \$3,500 was ap- ing. As the patient could give no information repropriated for introducing the water to the post. Soon garding the name or the quantity of the dose taken, after a storage basin of 7,000 gallons capacity was I administered an emetic while sending an assistant excavated in the rock, and a spring house of solid to the drug store for the desired information. While stone masonry, with walls four feet thick, twenty feet | the effects of the emetic (2 gr. tart. emet. and 20 gr. high, and substantially arched over, was constructed ipec.) kept the patient occupied, the assistant reto protect the spring from the floods and drift wood turned with the consoling news that the man had acof the creek, while an automatic valve was introduced tually swallowed seven drachms of the tincture of in the outflow pipe to shut off the back water from aconite at 3:30 P.M., or ten minutes before entering the stream when it should rise above the level of that my office. The assistant produced the vial from in the basin.

the wagons and stored at the dwellings in barrels as ter was heated and a quart of it administered with before; and it was not until the spring of 1885 that 3iv fl. ext. ipecae and zinc sulph. gr. ii. 6:00. Feels better, asks to walk around, and does clear orange-colored urine; takes freely of whiskey,

6:30. Sleepy, but very restless. Pulse 76 to 80; almost total loss of sensibility. Gave brandy hypodermically.

7:30. Stomach rejects everything given him, whiscocaine.

7:45. Pulse 80 to 85; respiration 14, at times very laborious; vomited stimulants given him; pupils natural, and readily influenced by light.

8:00. Two drachms whiskey are vomited up, and cause distressing hiccough; gave cocaine and nux vomica.

Thorough emesis; hiccough disappears; 8:20.

8:45. Pulse 72, small, compressible, thread-like; THE OPERATIVE TREATMENT OF RETROPERITOrespiration 12, laborious; feels chilly, has rigors, cold, clammy sweat over the body, stupor.

9:15. Vomits freely, has profuse perspiration, drinks and retains port wine, beef tea and coffee.

9:40. Emesis; nux vomica, coffee.

10:00. Emesis; cocaine 1/2 gr., by mouth.

10:10. Feels easy; respiration 12, regular; pulse 106. Discontinued battery, which had been used

uninterruptedly.

11:00. Emesis after \(\)i beef tea and a cup of hot coffee. Brandy hypodermically, which patient feels, being first return of sensibility; skin becomes warmer, pulse stronger; perspires profusely; feels sleepy, sleeps and rests well.

1:00 A.M. Awakes, is very thirsty. P. So, R. 17.

Drinks cold water; sleeps.

2:30. Awakes, drinks cold water, has severe frontal headache and pain in region of cerebellum. Tem-

perature 100.2°.

8:00. Feels well; has rested well for several hours; walks down stairs, urinates freely, returns and vomits without distress. Takes a dose of cocaine $(\frac{1}{50}$ gr.) and drinks some beef tea.

11:00. Has appetite; eats crackers and bologna, causing burning in stomach, which soon leaves him,

after which he feels well.

Remarks.—Emesis following so closely after taking the first emetic leads me to believe that the action of the aconite itself was the principal factor. Ten minutes after swallowing the aconite, it had affected the motor system sufficiently to seriously interfere with the patient's walking up stairs; he fell twice on the stairs, and could not rise again without assistance. When entering the office his knees gave away under him, bending forward. The sensory system was paralyzed to such an extent that he could feel neither the hypodermic needle nor the injection. The aconite was taken by mistake for whiskey, with the intention to relieve colic—and it effected a cure. Patient says that the time during which he had lost consciousness seemed like a dream to him. suffered an undescribable agony almost instantly after swallowing the poison, which was relieved as readily by vomiting. His own story was that he would as soon die as to suffer again the agony he did before vomiting. How he got across the street to my office he does not know. The injection of brandy at 11 P.M. produced pain, the first return of sensibility; from that time I considered patient out of danger, though I watched him closely all night. On the next day the palate and throat were congested; this readily yielded to a gargle of iron and chloride of potash. On the evening of the 15th the patient was taken nome in a sleigh, twelve miles, little harm. feeling well. When I saw him a few days after he told me that he never felt better in his life.

Patient took: Hypodermically, ½ gr. morphia, 6 drops ext. fl. digital., $\frac{1}{160}$ gr. strychnia, f.\(\frac{1}{2}\)j brandy; per os, 2 gallons warm water, 11 pints coffee, 3 pints whiskey, 20 drops ext. fl. digital., $\frac{1}{2}$ drachm ext. fl. nux vom., 12 pint port wine.

NEAL CYSTS IN CONNECTION WITH MICULICE'S METHOD OF DRAINAGE.

Remarks before the Chicago Gynwcological Society, March 13, 1887.

BY CHRISTIAN FENGER, M.D.,

OF CHICAGO, ILL,

It is not my intention to give an exhaustive review of the entire subject of retroperitoneal or parovarian cysts, but I merely wish to call attention to the subject for discussion, giving some of my own experiences, with a view of bringing out those of other Fellows of the Society. The subject is that of socalled parovarian cysts, or cysts of the broad ligament, or cysts with fimbriated epithelium, and I wish to call attention to a few facts concerning them before showing specimens.

We know that these cysts are said, in a great majority of cases, to develop from the parovarium, the rudimentary sexual remnant of the Wolffian bodies; more rarely, they are said to develop from the epoöphoron; finally, it is possible that cysts of the broad ligament may originate from hæmatomas. The canals of the parovarium being lined with fimbriated epithelium, may account for the fact that the inside of a number of these cysts is found to be lined with this

form of epithelium.

Parovarian cysts are typically mono-cysts. In this respect they differ materially from proliferating cystomas or other ovarian cysts developed in or into the broad ligament. Both classes are retroperitoneal cysts, inasmuch as they are situated behind the peritoneum of the posterior wall of the abdomen, but the cysts of ovarian origin are more likely to have only a partial retroperitoneal or intra-ligamentous development; that is, part of the tumor within, part outside of the broad ligament; whilst the parovarian cysts proper are more likely to be completely surrounded by the broad ligament. From the broad ligament, and separating its two layers, they commonly develop inward to the sides of the uterus and downward toward the bottom of the small pelvis.

They are usually thin-walled, lined with fimbriated epithelium or mixed fimbriated and common cylindrical epithelium; consequently their interior surface is smooth, and they contain a thin, colorless, clear fluid of low specific gravity, with no formed elements. Between the peritoneal covering and the cyst wall there is usually a layer of loose connective tissue with but few vessels; which explains the facility with which these cysts may sometimes be separated from the broad ligament covering them, and enucleated without the use of cutting instruments, and with very

A typical cyst of this kind should have the Fallopian tube on its outside stretched out and flattened, because the cyst develops into the little mesentery of the tube. In the same way the ovary is found stretched out and flattened on the outside of the cyst near the tube. Exceptions to these common anatomical characters, however, are found. cyst wall may be thick, may become the seat of secondary growths, such as papillæ or papillomatous inside of the cyst, may perforate the cyst-wall, pro- ation can be continued, without the use of any force trude on the outside, and take upon them a malig- and without appreciable hæmorrhage, until the cyst nant or semi-malignant character, invade the general is completely enucleated, and may be lifted out of peritoneal cavity, giving rise to multiple metastatic the cavity. Evacuation of the cyst fluid after partial papillomas.

In cases of this kind, the contents of the cyst is tates enucleation. not a thin, clear, serous fluid, but resembles more or

thin, clear fluid being absorbed quickly and readily. as these trifling operations are not uncommonly fol-

lowed by radical cures.

came under my observation in 1884. A girl 18 years of age came to me from Racine, who had a cyst extending above the umbilicus, and about the size of a woman, 22 years of age, from Racine, who had a interus in the seventh month of gestation. She had cyst which had been developing for two years. It been accused by her relatives of being pregnant, but was as large as a gravid uterus at term and contained knowing this was not the case, came on here. On a clear fluid. When the abdomen had been opened examination I found the uterus of normal size on one and the covering broad ligament had been incised side of the cyst, and in my office, with a common down to the cyst-wall, I commenced dissection with hypodermic syringe, I drew off and took away for a view to enucleation, but after working about half examination a perfectly clear fluid, and told the pa- an hour dissecting and ligating vessels, I had advanced tient to come down for operation. She went home but very little. All that I could get out of the cyst to make her arrangements, and came down a month was a piece as large as the palm of the hand. Conlater. The cyst had entirely disappeared, without sequently I was obliged to leave the cyst, after havsymptoms of peritonitis.

as to the correctness of the diagnosis of a parovarian cyst; but it is reasonably certain that this was the case, as one of the characteristics of this class of cysts is that rupture into the peritoneal cavity causes

difficulty.

The method of operating on these cysts we owe to Dr. Miner, of Buffalo, N. Y., who published in 1869 abdominal wound, but also for drainage in the peri-

his operation by enucleation.

The surface of the tumor, or, rather, the broad ligament is now separated from the cyst wall. By to the bottom of the cavity, and if nooks and corners

The connective tissue layer enough for the formation of a pedicle. In such between the cyst and the broad ligament may not be cases the usual operation for ovarian cysts may be loose and deficient in vessels, but is sometimes so performed at a sacrifice of the covering broad ligatense as to make separation of the cyst here almost ment, with tube and ovary. But such a peripheral or entirely impossible, and it may contain numerous development is not the rule, and whenever the cyst is developed down upon the uterus or into Douglas' As to the symptoms: The cysts usually grow fossa, or farther away still in the retroperitoneal space, slowly, and do not cause any inconvenience unless enucleation is the only method available for its complete removal.

Difficulties during the course of enucleation arise and superficial. When such a mono cyst is large, the when the connective tissue is tense and rich in vessels, necessitating dissection with the knife, and to change somewhat with the position of the patient, ops deep down in Douglas' fossa, or even behind tines, sigmoid flexure, or descending colon on the left The parovarian cysts are likely to burst spontane-side, or cacum or ascending colon on the right side, ously, but the contained fluid is so little irritative in we may find, in such cases, smaller or larger portions character that peritonitic symptoms rarely follow, the of these intestines spread over the surface of the cyst longitudinally and transversely, just the same as the On this account, these are the cysts of the abdominal Fallopian tube. It may be difficult, almost impossicavity which best permit of puncture or aspiration, ble, to remove the cyst wall from the intestines in such cases, and danger may arise from the fact that the intestines will not bear denudation of the mus-In this connection I will describe a case which cular layers to any extent, as it easily becomes gangrenous.

The first case 1 met with was that of a married ing united the opening into it with the abdominal In a case like this there may, of course, be a doubt wound and made use of a method of drainage of which I had intended to speak this evening, the socalled Miculicz drainage. The patient made a good

recovery.

About a year ago Miculicz, of Cracow, proposed no peritonitis, and the fluid is absorbed without the following method of drainage, not only for retroperitoneal cysts, which can be excluded from the general peritoneal cavity, by uniting them to the toneal cavity itself. He takes a small piece of iodoform gauze, stitches a silk thread to the centre of it, ligament, when exposed after the opening of the absend folds it up in the form of a pouch, the silk thread dominal cavity, is incised down to the wall of the being inside, that the pouch may be drawn up from cyst. In the loose connective tissue layer the broad the bottom by it. The pouch is now pushed down

I must say that I do not dare bring this fluid out of the glass drain, while the capil- to rely so fully on entire asepsis during the operation larity of the gauze is likely to help in that direction. I have had this remain in all these cases for about two of the patient is quicker and easier without than with weeks. As soon as the discharge ceases I commence drainage, as very often, in the latter case, a fistula first to pull out the loose ganze inside the sac. space is left after this has been pulled out I press in at that dressing a little more gauze. This is gradually removed, and the pouch itself is then pulled out by the thread gradually and finally. In all my cases peritoneal cyst, located partly in the peritoneal and it came out about the end of the second week.

The second case was similar to the first, inasmuch as there was no possibility, at least as far as my ability went, of getting the cyst out. It was a large cyst of eight years' development, in a woman fifty years of age, from Sioux City, Iowa. A prolapse of the uterus had developed during this time, and I was able to get out of the cyst, after considerable dissection, hardly more than two square inches. I used cyst the surface was rough, velvety from the diffuse the Miculicz drain with the same result as before. The patient was operated upon October 31, 1886.

> This is where the matter stands, and these are the as to leave drainage out. Undoubtedly the recovery If a remains which may keep open for months.

The fourth case was an old and rather anæmic patient, more than 50 years of age, but apparently 60. She was pale and emaciated, and had a large retropartly in the retroperitoneal cavity, or, in other words, of partly extra- and partly intra-ligamentous development. As a natural consequence, the enucleation was difficult, since the peritoneal cavity was at once entered. On the inside of the cyst were papillomatous masses such as are found in smaller growths, cystomas of the ovary. These, of course, always indicate malignancy. On the inside of this papillomatous condition of the entire inner wall, and in some places grown out into a large papilloma, but

The operation in this case was rendered more difclass them under unfinished operations, as far as the ficult, because the connective tissue surrounding the extirpation of the cyst is concerned. It equals antipyrin in the quinine or kairin. It is only excelled in the quick- for two months, but it was not until two days before, than those which diminish tissue metabolism.— British Medical Journal, April 23, 1887.

Conditions of Successful Production of Local Anæsthesia in Tooth Extraction.—Dr. A. LEBRUN, of Brussels, and his house-surgeon M. Andries, have published the notes of twenty-nine cases in which they employed local cocaine anæsthesia for the extraction of teeth. In twenty-three cases the anæsthesia was complete, in one case partial. In the remaining five cases the procedure was unsuccessful. This is attributed by them to the difficulty of introducing the short straight needle of the ordinary hypodermic syringe in the case of the second and third molars, and also perhaps Journal, April 23, 1887. to no precautions having been taken to prevent the escape of the liquid. They point out that M. Viau, of Paris, who succeeded in producing complete anæsthesia in every one of his eighty-six cases, made use of a specially constructed syringe, with a holder by which it could be grasped firmly between the index and middle fingers, and provided with needles of various degrees of curvature; also that; he surrounded the tooth with plugs of cotton-wool, and applied the finger over the puncture after the needle. Besides which he made the patient keep rinsing his mouth with cold water during the five minutes that intervened between the introduction of the cocaine and the actual operation. These precautions were not observed by MM. Lebrun and Andries. They used, however, a solution similar to that of M. Viau—viz., fifty centigrammes (seven and a half minims) of a 2 per cent. solution of carbolic acid containing five centigrammes (three-fourths of a grain) of hydrochlorate of cocaine, half of which quantity was injected into each surface of the gum. -*Lancet*, March 19, 1887.

Treatment of the Urethra after Removal of THE WHOLE PENIS.—MR. Page reports the case of man, æt. 57, the subject of phimosis, and of syphilis many years ago, who had had for twelve weeks a rapidly enlarging sore and growth on the penis, which on his admission to St. Mary's Hospital, involved the organ in settling that vexed and constantly recurring quesalmost down to the root, and was obviously an epithelioma (since confirmed microscopically). He had the after coming head. - American Journal of Obbeen under the care of a legally qualified practitioner stetrics, April, 1887.

ness of its action by the external application of when the ulcerated mass had attained this vast size, cold. Its effects are evident within an hour, and and the glands in the left groin were enlarged, and they last from ten to twelve hours when a full dose ulcerating, that the man had been advised to come has been administered. When administered for a to the Hospital. The penis was at once removed, long time, the dose must be increased. It produces and the scrotum having been divided through the profuse sweating and redness of the cheeks; it di- raphé, the corpus spongiosum—rendered rigid on a minishes the pulse-rate, and distinctly increases arte-staff—was dissected free from the rest of the penis, rial tension. I found no depressing effects follow its and so brought down behind the scrotum, where, administration even when full doses were given, ample in length, it was sutured to the skin. Re-Antipyretics belong to two great classes, namely, union of the scrotum completed the operation, a those which diminish tissue metabolism; and, drainage-tube being passed through it from above secondly, those which increase the loss of heat, downwards, in the site, that is, of the now displaced From the sweating it produces, and the rise in arte- urethra. At the same time glands were scraped rial tension, one might conclude that antifebrin be-raway from the groin, but no dissection was made, as longs to the second class as well as the first one, they seemed to dip deeply around the vessels. It This might explain the quickness of its action, as was hoped that some of the enlargement might be antipyretics of the second class act more speedily due to inflammation alone, and this happily turned out to be the case, for much of the swelling subsided, and when, fourteen days afterwards, a solitary protruding gland had been scraped out, the wound forthwith began to heal. The scrotal wound had healed immediately, and the man had no difficulty whatever, either in retaining his water, or in passing it in a sitting posture. There is no better method than this of dealing with the urethra when, the whole penis having been amputated, the urethral orifice must of necessity be sunk and lost within the scrotum. Impressed with its value twenty years ago in a case under Professor Humphry, in Addenbrooke's Hospital, I have practised it with advantage in other instances during the past few years.—British Medical

> THE MANUAL DELIVERY OF THE AFTER-COMING HEAD IN CASES OF PELVIC DEFORMITY .-- In a monograph Dr. A. Martin aims to prove the superority of the Smellie-Veit extraction of the aftercoming head over the forceps. This instrument he has had occasion to use only once in the course of an extensive practice. He tabulates thirty-eight cases in which he resorted to manual delivery in case of pelvic deformity. These thirty eight cases concern thirty-two mothers, and in eighteen the diagonal conjugate measured between nine and ten cm., in eleven between ten and eleven cm., in three between eleven and twelve. The following were the results in previous labors: Forty were spontaneous, twenty three required the forceps, nine version, three extraction, three perforation, two induced labor. Of the thirty-eight labors conducted by M., thirty-one children were born alive (in ten with pressure markings), seven delivered dead, six of whom had succumbed before manual delivery of the head was resorted to. In none of the living children was there any evidence that the method of delivery had been injurious, and the same remark holds true of the mothers.

> These statistical data certainly speak in favor of the Smellie-Veit extraction method and are valuable tion as to the advisability of applying the forceps to

SATURDAY, MAY 21, 1887.

AMERICAN MEDICAL MISSIONARY SOCIETY.

To answer a number of inquiries in the most economical and satisfactory manner, we will state that a preliminary organization of this Society was effected at a meeting of physicians and clergymen of different denominations in this city, in March, 1885, and it was legally incorporated in July following. The experience of missionaries in all uncivilized and pagan countries had made it apparent to all interested in the spread and ultimate triumph of Christianity, that the greatest obstacle in the way, was the great difficulty of gaining access to the people of those countries; and also that the most Christian character, and both mental and physical successful mode of overcoming this obstacle, was to ability for Christian missionary work; and also guard qualify the missionaries to perform successfully all against the tendency manifested in some quarters to the duties belonging to practitioners of medicine send, as *medical missionaries, men and women with and surgery. But to acquire such medical qualifica- only very inadequate amount of medical knowledge. tions and skill by the missionary, requires not less. It is not the intention of the members of the Society than three years of faithful study and a correspond- to devote any part of the money that may be reing expenditure of money, while but a very small ceived to the establishment of any medical college, proportion of the young men and women who are as the work can be more economically and efficiently willing or anxious to spend their lives in endeavoring done in the best class of medical colleges already to convert the heathen to Christianity have the established in various parts of the country. As pecuniary resources necessary to enable them to none of the officers receive salaries, all the money gain the medical education desired. Hence it be- contributed can be devoted directly to the work of comes necessary to make adequate and reliable pro-education, except a very limited amount for stationvision for enabling such to accomplish that object, ary, printing, etc., for the Secretary and general agent. and thereby enable them to do more both in extend- In the brief period since its organization, the Soing a knowledge of Christianity and in relieving ciety has received in all eight students. Three of human suffering as missionaries among the people of these entered the Rush Medical College, four the Asia and Africa in ten years, than they could do in Chicago Medical College, and one the Woman's thirty without the knowledge of medicine.

for this purpose only has it thus far prosecuted its The Society is inter-denominational and evangelical in character. It is constituted of three departments: 1st, a Board of Managers having the supreme control; 2d, a Board of Honorary Directors having advisory functions; 3d, an Executive Committee composed of the officers of the Board of Managers, having the power to transact the business of the Society during the recess of said Board. It is no part of the object of this organization to establish Foreign Missions, or to send e ther physicians or ministers into the missionary fields of labor under its own superintendence, but to furnish systematic and well directed aid in furnishing a full medical education to such young men and women belonging to any of the recognized evangelical Christian denominations as can comply with the following rules:

- 1. Every applicant must furnish the Executive Committee satisfactory testimonials of earnest Christian character and ability for Christian work from his or her Church, Society, or Board of Missions.
- 2. Every applicant must be a graduate of some college, or furnish evidence of having received a fair liberal education.
- 3. Every applicant must pass such a physical examination as is required by our good insurance companies.
- 4. Every applicant must agree to take a full medical course of three years, and to graduate.
- 5. Every applicant must bind himself or herself, on completion of the course of medical education furnished by the Society, to go out to the foreign field as a medical missionary, or else to pay back to the Society the cost of the medical education furnished.

It will be seen that these rules exact evidence of

Dana's experience, wherein he states very plainly dents who offer themselves as willing and desirous that, in his hands, the method has not produced such to go to the foreign field. Here are nearly 1500 results as are claimed by many others. On the other them to be educated as medical missionaries, with to its remarkable efficacy in certain cases. This is parbe the case, the query arises at once, to what is this due?

From a careful perusal of the literature of the subject to the present time, as well as from personal experience and conversations with many practitioners in this city who are trying the method, we are inclined to think it is not so much owing to inefficiency of the method itself, as to defects in its administration. have used for the most part sulphur waters without knowing the percentage of sulphuretted hydrogen they contained or gave up to the stream of earbonic acid passed through them. Take, for example, the Ypsilanti water, so extensively employed in Chicago and vicinity: It is said to contain 21.0786 cubic inches of hydrosulphuric acid to the gallon. Yet it is fair to assume that, brought from the spring in barrels and bottled here, as it is, much of its free gas has escaped. So far as we can ascertain, no analysis has been made of the two gases after having passed through the wash-bottle, with a view to ascertain the proportion of the two. If we are not mistaken, M. Bergeon charges his carbonic acid with 1 per cent. of sulphuretted hydrogen. Does any physician here know exactly what percentage of the two he himself has been using?

Again, a number of the physicians here have been in the habit of filling their gas bags with several gallons of CO₂ and depending upon this supply for several treatments on successive days. This is bad, since atmospheric air enters the rubber receptacle by endosmosis, under such circumstances, and occasions colic to the patient. Moreover, the apparatus, used in this country generally, does not admit of an accurate measurement of the amount of gas injected; the argument that one can determine this by the number of times the pressure bulb is emptied, to the contrary notwithstanding.

In the light of these and other facts, best known, perhaps, to each practitioner, is it fair to M. Bergeon to content ourselves with inexact trials of his method? Would it not also, for our own sakes, be well if some of our physicians with hospital opportunities at command, were to undertake a series of careful experiments to fix definitely the dosage of the two gases, and thereby establish this treatment upon a scientific basis? If such investigations are being conducted in this country, we have not heard of them, and shall give their results hearty welcome.

For a more careful consideration of this subject we would direct especial attention to the admirable presentation of certain facts in regard to the proper use of Bergeon's method in the letter by Dr. Babcock in another department of this issue of The Journal.

PHYSICIANS' NAMES IN NEWSPAPER ADVERTISEMENTS.

In the Chicago Times, of May 8 and 15, appeared an advertisement of the Ypsilanti Mineral Water as a positive cure for consumption, rheumatism, catarrh, cancer and other diseases, with extracts from an article read before a recent meeting of the Chicago Medical Society on Bergeon's method of treating phthisis, and illustrated with a cut of the apparatus made by E. H. Sargent, of this city, for administering the gas. The advertisement also contained the names of several well-known physicians of this city, and in such a manner as to show that they practically endorsed all that was claimed in the absurd advertisement.

In an obscure corner of *The Times*, of May 15, was published a protest from several of the physicians against such unauthorized and outrageous use of their names by an advertisement in a daily newspaper. But, as already said, their names were again used in a similar advertisement in the same issue.

We are authorized by Drs. Robert H. Babcock, Charles Gilman Smith, Sarah Hackett Stevenson, M. R. Brown, Wm. T. Belfield, Marie J. Mergler, C. M. Fitch, and Walter M. Fitch to state that such use of their names was unauthorized, and without their knowledge or consent; an outrage both to them and to every reputable physician in Chicago; and they do not recommend the Ypsilanti water as the best source from which to obtain the sulphuretted hydrogen for Bergeon's method-and the reason for this may be more clearly seen in Dr. Babcock's letter on Bergeon's method, in this issue of The Journal. But even were the Ypsilanti water the best source, the proprietor of that water justly deserves the condemnation of all reputable physicians for his improper methods of advertising, and for his unwarranted use of the names of reputable physicians. Nor is there any reason why Mr. Sargent should advertise his apparatus in the secular press. The public cannot and should not use the apparatus, since in hands other than those of physicians great injury to the patient may result.

We are informed by an attorney that physicians whose names are thus used can most probably stop it by legal proceedings. Is it not time that something of this kind be done? Are the names of reputable physicians private property, or do they belong to any quack advertiser who thinks he can make money by using them improperly? Here is one of the most flagrant violations of common decency to members of the profession that has occurred for some time, and it is to be sincerely hoped that the physicians of

Chicago will show that such methods will be neither endorsed tacitly (by inaction) nor patiently endured. Is it not a duty to themselves and to other physicians to stop such advertisements at once and permanently?

SOCIETY PROCEEDINGS.

CHICAGO GYNÆCOLOGICAL SOCIETY.

Regular Meeting, Friday, March 18, 1887. THE PRESIDENT, CHAS. WARRINGTON EARLE, M.D. IN THE CHAIR.

Dr. W. W. JAGGARD presented a

PUERPERAL UTERUS, SHOWING ENDOMETRITIS PUERPERALIS.

The material was placed at his disposal through the courtesy of Drs. Pickard, Hibbard and Plummer, of the Cook County Hospital.

History.—Patient 64003, Ward 14, Swede, 24 temperature goes down at once. years old. I para. Labor March 13. presentation, R. O. P.: First stage, ten hours; the practice of a graduate of one of our schools, a second stage, three hours; third stage, ten minutes; male child; wt. 6 lbs., 13 oz.; condition good. Severe post-partum hæmorrhage, after expression of placenta; intra uterine irrigation with hot water, vinegar, finally mercuric chloride, 1: 4000: perineum next day it was 1051/2 F. I curetted and brought sutured, vaginal douche. Chill, three hours after away a mass of material which surprised me as well delivery; temperature 101.8° F.; pulse rapid and feeble. Patient died four days later; temperature reaching the maximum, 103° F. a few hours before

The autopsy disclosed puerperal ulcers in the vagina, diphtheritic endometritis, splenic tumor, ulcerative septic endocarditis. The ovaries, tubes and peritoneum were not involved in the inflammatory process. The case apparently corresponded to proper treatment. the form, described by Buhl in 1861, as "Puerperal pyæmia without peritonitis" (metro-phlebitis). The fall, I saw a case of abortion, not childbirth, where poison had apparently gained direct access to the veins, the endometritis being only a prominent symptom.

puerperal fever. Rigid antiseptic precautions, in the placenta. conformity with the Semmelweis doctrine-every Jaggard wished to make was upon the use of mercuric entered the veins. chloride for the purpose of intra-uterine irrigation.

Dr. Charles Warrington Earle: I think there is evidence accumulating at this time which shows A CASE OF REMOVAL OF THE OVARIES AND TUBES that we are not certain that the decidua comes away completely, and in a great number of cases there is

not only a considerable amount of this left, but also pieces of membrane, etc., which no one, however careful, can detect. Whenever a high temperature takes place on the eighth or ninth, or tenth day, I am in the habit of washing out the uterus, and then if the high temperature continues, to curette, and in almost every case the amount brought away astonishes everybody, particularly the attending accoucheur. Sometimes 2 or 3 drams are brought away; the temperature becomes normal in twelve hours and a speedy convalescence takes place. I would like to ask what the experience and observation of the other Fellows of the Society has been in regard to the certainty which they feel that everything comes away.

I am getting together a series of eases in which I will endeavor to show that where there is a high temperature that comes on as late as the tenth or eleventh day, if it does not come down after a thorough intra-uterine douche with carbolized water, curetting should be resorted to, and that it will in almost every ease bring away an amount of material that none of us expect. In many of these cases the

I had a case on Hoyne street, which took place in young man of excellent record, and one who is thoroughly in accord with us on antiseptic obstetrics. On the tenth day the temperature was 103½° F.; an intra uterine douche did not bring it down. The as the practitioner. The woman made an excellent recovery without a bad symptom.

Dr. A. Reeves Jackson: It seems, to look at this specimen, that the curettement would have to be exceedingly deep; especially after the infection of the walls, you could hardly get away all the septic influence. There may have been a stage in the history of that case in which it would have been a

The vomitus, which was placed in brought up for discussion in the Berliner Klinische of arsenic. That of May 8th contained one third of Medicinische Gesellschaft last fall, between Leyden a grain. The urine of May 1st and 2d contained and Virchow, in which no definite conclusion was 5.4 mg. It was thought that this amount of arsenic might have been contained, as an impurity, in the I fully agree with Dr. Etheridge that vaginal drain-medicines prescribed by the person attending the age, mechanical of course, is the most rational patient. These were examined, and were found to method because it draws best. My own experience be free from arsenic. The intermediate urine, until is limited as have only employed it twice, and both! June 1st, was not examined, but that passed on June patients died. We dread the vagina as a septic 1st was examined, and was found to be free from arcavity and the reason why we should not drain senic. The date when the arsenic disappeared from through it, is fear of sepsis from the vagina up into the urine is, therefore, not yet definitely known. the abdominal cavity. But I believe with our new The only other case in which analysis was carried precautions, the vagina could be kept so aseptic that out in this way was that of a patient who, by misretrograde sepsis from it could be prevented, I be- take, took, during a considerable period, a poisonous lieve also that vaginal drainage ought to be used dose of Fowler's solution, and the symptoms of armore than it is, and we need not be so afraid of it as senical poisoning were rapidly induced. In this ease, analysis at the end of six and one half weeks showed arsenic, but the urine, when examined at the end of seven and one-half weeks, did not contain arsenic. The occurrence of paralysis is not confined to chronic forms of arsenical poisoning, but may follow acute poisoning from this cause. Seligmueller quotes several such cases.

Dr. Prince said that he had made, by request, an examination of the nerves and muscles in this case. At that time the patient was almost completely paralyzed from head to foot, only a few movements being left, and these difficult and painful. Even moving the limbs passively caused great pain. There was more or less complete loss of sense of touch over all four extremities. Sense of pain was increased over some parts, but perception of it was retarded three seconds by the watch. Perception of Faradic cur-Dr. Cushing stated that the circumstances of the rent also diminished. Loss of Faradic excitability

The interest in this case, as indicated by the title be useful to members of the medical profession to of the paper, centred in the question of the nature know how difficult it is to bring a case before the of the paralysis, and the other allied symptoms. Were courts, even when the evidence is apparently plain they due to arsenic or to alcohol? In the first place there is no question but that arsenic was given to the man, and that, too, in poisonous doses. But on the in the spinal meninges of a dog which developed other hand, the man was a hard drinker, was in the habit of going on constant sprees, lasting many days at a time, and had just been on a hard spree when iments on animals, and we do not find that any exthe attempt was made on his life. Now the paralytic picture presented was just that of alcoholic paralysis in its most severe form. Alcoholic paralysis has only recently been thoroughly studied and understood; in fact, the best observations have been be due to multiple neuritis. On the other hand, a made during the last two years, and since the above case occurred. The *clinical* picture is just such a one, in almost every detail, as that which we are discussing. There is the extreme and general paralysis, the loss of sensation with hyperaesthesia, the pain fatally, and had come before a jury, whatever anyand the atrophy with the reactions of degeneration. The resemblance can even be extended to the mental condition. According to Dreschfeldt and Buzzard2 there is a peculiar and characteristic delirium observed in alcoholic paralysis. A similar mental to alcohol, and even that this might not have been condition was present in their case.

senical poisoning. In the severe cases there seems is likely to arise again in other cases. A decision to have always been present the main and salient under such circumstances can only be arrived at by symptoms, namely, paralysis with atrophy and reac-extending our knowledge of the action of arsenic on tion of degeneration, loss of sensation, pain, and hy-the spinal cord. Dr. T. A. DeBrois exhibited a

NEW FORM OF PHYSICIAN'S HANDBAG,

which he had recently had made. It consists of an ordinary leather bag, of medium size, but is about one-third deeper than the ordinary bags. At one end of the bag is an opening near the bottom, which can be closed by a flap which buckles tightly. This opening displays the end of an air-condenser, with two cocks, and a pressure-gauge. In the bag can be carried a small pump, by which the air can be forced into the condenser. In the space of two minutes Dr. DeBlois was able to obtain a pressure of thirty five pounds to the inch without great exertion. The apparatus is then ready for use as a spray for the throat, the use of the Evans' inhaler, or for any other purpose to which this treatment is applicable. The bag is sufficiently capacious to accommodate all the articles usually required. The weight is not materially increased by the addition of the condenser, and the whole apparatus is not too heavy to be easily taken in the hand when walking. It is manufactured by Messrs. Codman & Shurtleff.

LETTER FROM NEW YORK.

(FROM OUR OWN CORRESPONDENT.)

Casarean Section—Craniotomy—Laparo Elytrotomy.

Medical Association Dr. Lusk reported a case of but at the same time there was a certain feeling of Casarean section, operated on by Sanger's method, security in having it. On the 6th day there was some The case shows the importance of operating early in oozing from the orifice left by it. At the end of a labor, of proceeding with deliberation, and of using week the abdominal suture was removed, and at this strict antisepsis, as well as the advantages of con-time the temperature would usually go up to about stricting the uterus with a rubber ligature to prevent 100.5° in the evening, falling again by morning. On hæmorrhage during the incision of the uterus, extractible oth day some fluctuation was discovered at one tion of the child, and suturing of the uterine wound. point in the line of the abdominal wound, and a little The patient was 24 years old, a native of Ireland. pus was evacuated; after which the temperature be-On March 21 she was admitted to Dr. Lusk's service came nearly normal. At the end of two weeks, howat Bellevue Hospital, on account of deformity of the ever, the temperature suddenly rose to nearly 103°, pelvis resulting from hip disease when a child. When No trouble whatever could be detected about the 11 years old she was treated for this at a Dublin hos abdomen, and as the patient complained of pain in pital, and discharged cured; but during her pregnancy the region of the right hip, an examination revealed she noticed some suppurative discharge from the old an accumulation of pus in the site of the old sinuses. sinus which had formed at this time. Dr. Lusk made After that time the patient continued in excellent an examination on March 22, and to his surprise he condition, and the child was in equally good condition. found that labor was already commencing. The pubis was a Næglé oblique, and its diameters much late House Surgeon in Bellevue Hospital, who had contracted. After consultation with Dr. Isaac E. had charge of it, said that altogether the patient did Taylor and Dr. H. J. Garrigues, he decided to per-| better than any other case of laparotomy that he had form Cæsarean section. With the pubic diameters the opportunity of observing during his service at the in this case he thought the danger from craniotomy hospital. As regards the result of Cæsarean section section, provided the latter were performed early to the nineteen cases in dwarfs which Dr. Robert ecough. As the patient was already in labor, he de-Harris, of Philadelphia, quoted in tabulating one termined to operate at once. Both the private pa hundred operations in 1878, and in which only one vilions at Bellevue being occupied, the operation was mother and five children were saved. In all these done in one of the hospital wards.

abdomen, as were also the intestines, which were held and desirability of early surgical interference.

out of the way by means of towels. A rubber tube was then placed around the uterus, and an incision two inches long made in its lower segment; the opening was afterwards increased to five inches by means of scissors. Owing to the pressure of the elastic ligature, the incision was almost entirely bloodless. The child was found with the head presenting in the L. O. A., and when extracted was in a cyanotic condition from the pressure exerted by the constricting rubber; but it was successfully resuscitated. The placenta and membranes were then readily detached by the finger from the uterine walls. In closing the wound thirty-four carbolized silk sutures were used, sixteen deep, eighteen superficial. In the deep sutures the mucous membrane of the uterus was avoided. When the rubber band was removed blood slowly returned to the pallid organ, which first became of a delicate rosy hue, and finally of a deep purple. A slight oozing was then observed at one point, and after it had ceased the uterus was returned to the abdominal cavity; a drainage-tube being inserted behind it. Silver wire sutures were put into the abdominal wound, and the patient was in excellent condition at the end of the operation, which lasted 1.15 hour.

For 3 days the temperature never rose as high DOMESTIC CORRESPONDENCE as roo; then there was a little tympanites, and it went up above 101", but a Seidlitz powder had the effect of promptly reducing it. On the 5th day the drainage tube was removed. Immediately after the operation the discharge from it was stained with blood, but it soon became colorless. Dr. Lusk thought that At a recent meeting of the New York County the tube was not really needed in this case at all;

In the discussion on Dr. Lusk's case Dr. Sylva, would be actually greater than that from Cæsarean when the operation was unduly delayed, he referred cases the operation was only undertaken as a last The abdominal cavity having been opened by a resort, when the patient was utterly exhausted; and median incision, the uterus was turned back over the the results afforded ample proof of the importance

in such a case to perform Porro's or Tait's operation, believes that he could now have saved this case also. in order to prevent the woman's becoming pregnant | Very few obstetric surgeons, certainly, could show a again, Dr. Lusk said that statistics showed that with result of 90 per cent. of recoveries in their cases of the Sänger operation (more or less modified from the craniotomy. Within the last eighteen months Harris original procedure) there are over 70 per cent. of has collected 40 cases of Cæsarean section, with 73 recoveries, but only 40 per cent. in Porro's operation. per cent. of recoveries; while the best results of In regard to Tait's operation, the additional risk to craniotomy in these difficult cases show only 60 per which it subjected the patient was by no means ad-cent. of recoveries. Other operators than Leopold

rience he had had to perform craniotomy three times, and he thought that this class of cases was as disagreeable and repulsive as one could by any chance meet with. If, therefore, by this operation it was possible to save more more more more more more than by craniotomy edges of the wound together with the greatest it would be a great boon. Unfortunately, however, accuracy. statistics showed thus far it had saved a much smaller proportion of mothers. In two of the cases of cra- to his opinion of the operation of laparo-elytrotomy niotomy that he had met with the mothers recovered, in these cases, Dr. Lusk said that this procedure was upon to perform craniotomy, he was improvided with If, however, we were obliged to pass the forceps interest as showing what sometimes might be accom- 6 recovered, and 6 died; the latter being cases in plished by very simple means in an emergency. He which success was impossible from the existing consaid he was one of those who believed that the mother ditions. should always be saved at all hazards, whether the child was sacrificed or not; and as long as it could be shown that more mothers' lives were lost by the Caesarean section than by craniotomy, he thought the latter should be given the preference.

and carcless way of operating had also been the rule, from Les Nouveau Remèdes, November 24, 1886. it was hardly to be wondered at that the patients died, of the procedure. But, even under all these adverse present time it is getting to be understood that the operation should be performed, whenever this was possible, under more favorable conditions, and in the same careful way as any other surgical procedure intake sufficient time to make out the pelvic diameters, and consider fully the risks to be encountered in performing craniotomy. If, having done this, he de-

BERGEON'S METHOD OF TREATING PHYHISIS.

Dear Sir:—My object in addressing you is not to present the results of personal experience with M. Dr. Lusk said that in the old Caesarean section, Bergeon's method of treating phthisis, nor to make the mortality was without doubt very large. In most original suggestions for its improvement. I desire of the cases it was resorted to only when the woman only to state a few points concerning the preparation was in a dying condition, and after all other methods and amount of carbonic acid to be injected, as well of delivery, craniotomy included, had been tried in as the proportion of, and best mode of obtaining the vain. When it was remembered, too, that a rough sulphuretted hydrogen. These have been gleaned

But before considering them, I should like to menand that such cases militated strongly against the value tion the points wherein, as it seems to me, we American physicians have been at fault. The attention of circumstances, a few cases had recovered. At the the profession in Chicago was first directed to Bergeon's method by Dr Henry Bennet's paper in the British Medical Journal, December 6, 1886, and our apparatus has been constructed after that of M. Morel which Bennet described. We have prepared volving the abdominal cavity. The operator should our gas in the way he suggested, and, not being able to obtain Eau Bonnes, we did the next best thing, employed native sulphur waters, chiefly that from Ypsilanti. Or, if not natural mineral waters, we have cided that the Casarean section offered the best followed the lead of Philadelphia men, and used 5 chance of success, he should make his preparations grains each of sulphide and chloride of sodium in 20 as deliberately as possible and perform the operation ounces of water. Furthermore, not satisfied with by strict antiseptic methods. In this way the results employing the apparatus in strict accord with Bergeare infinitely more satisfactory than in the old oper-on's principles, as enunciated by Bennet, some of ation, as shown by the cases of Leopold, who has us have been in the habit of generating enough caroperated ten times, with only one death, and who bonic acid to suffice for several treatments, instead be sure, it is claimed that one can ascertain this by thus precluding the entrance of atmospheric air. measuring the capacity of the pressure bulb. This, they have injected.

Omitting for the present the fact that sulphuric proportion of the two gases is too little to produce per cent. the results obtained in France. Yet, if there be a offered in the French article mentioned above.

before being filled with carbonic acid. 2. The CO, the latter. should be generated by the action of a vegetable 4. An artificial solution of sulphuretted hydrogen is tions. In closing let me thank H. C. Wood's con-

of filling the gas bag afresh on each occasion. When fully as good as, if not superior to a natural sulphur gas is left in the rubber bag, atmospheric air enters water. 5. This water should consist of a solution of by endosmosis and is liable to give the patients colic, sodium sulphide of such strength as will furnish a an objection to the treatments of which I have heard definite quantity of hydrosulphuric acid. 6. The physicians complain. Furthermore, the quantity of rectal nozzle should not be introduced until the gas administered has not been exactly known. To medicated gas has begun to flow out of its extremity,

Tartaric acid is preferred to a mineral acid on the I think, is an error, since when the bag is full and ground that the latter generates vapors which may the gas under high pressure, it will bubble through render the CO, irritating to sensitive, ulcerated bowthe bulb in a steady stream. Also, as the gas grows els. Personally, I have found my CO2 would make less in the reservoir, the amount ejected by each my nostrils sting even after it had been passed pressure of the bulb becomes less than at first. Hence, through the mineral water. Hence, although tartaric the claim appears to me just, that for the most part, acid is dear, I shall advocate its use. A sufficient physicians have not known accurately howmuch gas -quantity to charge the gas bag for a single treatment would cost about five cents.

Eau Challes is stated to be the strongest sulphur acid is used in the generation of the carbonic acid, water in France, containing an amount of sulphides there is the source and percentage of the sulphuretted capable of evolving in the presence of tartaric acid hydrogen to be considered. The great demand for 150 cc. of sulphuretted hydrogen to the litre of water. Ypsilanti water reveals that in most instances it is In order, therefore, to produce an artificial water of the mineral water employed hereabouts. According equal strength, the two following solutions are used to the official analysis of this water, it contains 21.0786 at Cochin Hospital, Paris: No. 1, of pure sulphide cubic inches of free hydrosulphuric acid to the gal- of sodium, 10 grammes; of distilled water, 100 cc. lon. A trifling computation shows that I litre of the Solution No. 2, of tartaric acid, 25 grammes; salifresh water holds about 91 cc. of free sulphuretted cylic acid, 1 gramme; distilled water, 100 cc. The hydrogen, and a 😳 litre, therefore, in the neighbor-prodium sulphide must be pure and fresh. The salihood of 45 cc. But does anybody imagine that the cylic acid does not all dissolve, but is added to prebottled water sold to us here at such exorbitant prices went the development of fungi. When I cc. of the holds anything like as much free hydrosulphuric acid second solution is added to i cc. of the first, exactly as that freshly drawn from the spring? The water is 10 cc. of pure sulphuretted hydrogen are generated. brought here in barrels and then bottled. Under such Therefore, if 15 cc. of each solution are poured into circumstances it has lost probably more than half of a litre of plain water, 150 cc. of hydro-sulphuric acid its free gas. But granting that it still contains the are set free, and an artificial sulphur water of equivahalf of its original charge, a pint of the water (a pint lent strength to Eau Challes is produced. Now, being little less than 1/2 litre) would hold less than elsewhere in the article referred to, it is stated that 23 cc. of sulphuretted hydrogen. Now, if 4 litres 250 cc. of the sulphur water are put into the washof carbonic acid be passed through half a litre of the bottle through which the CO, is to pass. This water, it would therefore become charged with less amount, one fourth of a litre of water containing 150 than I per cent., even should the CO, cause the sul- cc. of free sulphuretted hydrogen, would yield to 4 phides contained in the water to give up still more litres of CO sent through it, one-fourth of 150 cc., sulphuretted hydrogen. As will be seen later, this or about 40 cc. of the medicament; and this is r

The question may here be asked: Does the carlarger percentage of sulphuretted hydrogen in Vpsi- bonic acid absorb all of the free sulphuretted hydrolanti water than I have supposed, there is still the obgen in the water? But, whether it does or not, this jection that its actual amount is unknown. Finally, appears to be the proportion of free hydrosulphuric this water is so dear, and the outrageous advertise- acid held in the water employed at the Cochin Hosment of it in the Chicago Times, May 8, was of such pital. In order to obtain the required amount, then, a nature, as to lead to the inference that the dealers for a single treatment, one should proceed as follows: in the water are disposed to fatten off of the neces. After having filled the gas bag with 4 litres of CO2 sities of suffering humanity. Therefore, led by the pour into the wash bottle 250 cc. of warm water, and considerations just stated. I have ventured to place then add separately 4 cc. of each of the solutions before the readers of The Journal the suggestions given above. You will then pass 4,000 cc. of carbonic acid through water holding in solution 40 cc. 1. The gas-reservoir should be emptied of all air of sulphuretted hydrogen, which is 1 per cent. of

Here, then, is something approaching accuracy; acid, preferably tartaric acid, upon sodium bicarbon- and if these directions, as furnished by Les Nouveau ate, in proportion of 16 grammes of the former to Remèdes, are followed, it is to be hoped we shall soon 20 of the latter. 3. The quantity of gas injected at have more satisfactory results to report in this couna time should not exceed 4 litres, in some cases only try. As yet I have not had time to report the effect r litre, according to the requirements of the patient. For treatment carried out according to these sugges-

tribution to the Therapeutic Gazette for having put lapses, although infrequent, do occur. "Case where," different conclusions from its statements than those 441. On page 284, the author states that hydramgiven by him. In another letter I may describe a nios, or hydramnion, is an incorrect term, polyhysimple apparatus by which the quantity of carbonic dramnios being preferable. He persists, however, acid injected may be accurately measured. Very in the use of the alleged incorrect term, pp. 284, 384. respectfully, Robert H. Babcock, M.D.

me on the track of the article in the French journal, instead of "Case in which," disfigures the appearalthough it would seem that I have drawn widely ance of many an otherwise fair sentence, pp. 178,

Let us pass on to the matter of the book. Parvin has attempted "to present the most recent information relating to obstetrics, at the same time not overlooking important truths established by past experience"—truly a difficult task, never, up to the present time, adequately performed by any American or English writer. In the execution of this object, he has drawn too exclusively from French literature, while he has neglected, to an utterly inexcusable degree, the teachings of the Germans in general, and stetrics and Diseases of Women and Children in of the Vienna School, in particular. The Vienna Jefferson Medical College, Philadelphia, and one School is very generally and very justly regarded as of the Obstetricians to the Philadelphia Hospital. a sort of ultimate court of appeal, in all matters per-Octavo, pp. xv, 701. With illustrations. Phila-taining to the science and art of midwifery, and its

This defect constitutes an essential weakness that Few books issued from the American press during cannot be remedied, the severest criticism that can the year, have been awaited with the same degree of be passed upon the book. It may be said in palliaexpectancy as "Parvin's Obstetrics"—a fact not at tion of this fault, that most Americans are familiar all remarkable, in view of the author's well earned with German modes of thought, while they are comreputation and great influence as practitioner, teach- paratively ignorant of French notions. In the utilization of the work of other men. Parvin thoroughly tense interest to every member of the profession, maintains his own individuality. He never sinks to gelberg's magnificent classic. The results of his own "The first necessity of a book," says Edward E. observation and experience are recorded with be-

Let us examine the book in detail. Parvin still prima facte, a right to put it on one side, before it insists that the sacro-iliac and pubic articulation are puts me to sleep." Parvin's book is entertaining, symphyses, and not true joints (p. 25), the results of No one can go to sleep over it. From introduction the investigations of Luschka, Strauss, Müller, Butheir number and arrangement, the acute student of ant subject of velamental insertion of the cord (pp. verbal criticism is at once apparent. Clearness, 131, 132) is disposed of in twenty seven words—conforce and elegance are the essential qualities of his veying an erroneous notion of the condition-and "Management of Pregnancy," p. 210; "Lactation," mammary gland, in utero, in the production of the sense of humor pervade the book, but the dignity of of colostrum in the new-born, male and female (pp. the subject is never lowered by coarse or unseemly 88, 545). The chapter on the behaviour of the cerjests. It is not a little annoying, however, to note vix uteri during pregnancy and labor—a subject of numerous and important typographical errors in a great theoretical and practical interest—is totally piece of literary work of such a high order. Ben inadequate. Hegar's so-called new sign of preg-Jonson wrote Partholomew Fair, not "Vanity Fair," nancy is worthy of more distinct recognition than ride p. 156. Then, Littlewit's words were, "O yes, the scant inaccurate allusion on page 184. Rasch's Win: you may long to see, as well as to taste, Win: sign of uterine fluctuation, detectible through the see the anatomy, Win? or the lady, Win, that de not mentioned. Mediate auscultation (p. 189) with

¹ William Gifford: The Works of Ben Jonson. London, 1873, p. 325. 2 Bruish Medical Journal, Vol. ii, 1873.

mediate auscultation, and take advantage of a poor also seem to indicate that he had read very little on woman, when the cry of shame was hidden by the this topic, -asice from Playfair's Treatise, Fifth Edicry of pain. Mediate auscultation, unless the bell tion, 1884, vol. ii, p. 224. It is unnecessary to add of the instrument be very large, is practically useless, that decapitation is justly regarded by authorities on in the recognition of the sounds of the foetal heart, operative obstetrics as the most difficult, and one of as a very limited experience will convince the most the most dangerous procedures, in this special decasual observer.

On the treatment of placenta pravia, Parvin 1emarks: "If loss of blood be slight, and especially ciently grave in nature to imperatively demand that if the feetus be not yet viable, the expectant plan is the chapter be re-written. indicated" (p. 319). Experience teaches that there is no expectant treatment of placenta pravia, and ries" as the best exposition of the subject, issued that the evacuation of the uterine contents is urgently indicated as soon as the condition is discovered. As and we know of no book, equal to it in all respects, a matter of fact, however, unavoidable hæmorrhage that has emanated from an English source. It must seldom occurs before the latter part of the second half of pregnancy, and the induction of premature. The author has not given us that which his distinlabor—not of abortion—comes up for consideration. guished ability entitled us to expect. The cotton tampon, as a means of checking hæmorrhage until the os is sufficiently dilated to admit of version or the forceps, is discussed at length, but no allusion is made to the far simpler, safer, and more effective method of colpeurysis, proposed and practiced by Carl Braun. Then in the employment of the cotton tampon, there is no necessity for stuffing the vagina to its maximum capacity, as illustrated in the cut on page 322. The Vienna method of perineal protection-effective in the large majority of cases—is inadequately described on page 411. The balloon catheter of Gustav Braun and Hüter is not mentioned in the paragraph on "Insuttlation through a Tube passed into the Larynx" (p. 420) The prophylaxis of puerperal fever is disposed of with a single page (593) of vague generalizations, a subject. in the light of the discovery of Semmelweis, that justifies, demands the use of dogmatic aphorisms.

The weakest part of the book is the chapter on "Obstetric Operations" (p. 601). Wright's method of version is not at all identical with Braxton Hicks' method, as intimated on page 607. We look in vain for a discussion of the "conditions" and "indications" for version—an unpardonable omission. The weight of professional opinion is so opposed to the application of the forceps to the pelvis, that the description of the mode of application, on page 646, is unneces sary. Cephalotripsis is practically an obsolete operation, yet it is fully described and well illustrated. Treatment of Felon Without Incision." Cuts of old-fashioned instruments mar the pages devoted to craniotomy. Levret's murderous perforator and Meigs' craniotomy forceps seem in the mind. Bergeon's Treatment." of the author to be adequate substitutes for Carl Braun's curved trepan and cranioclast! The Smellie-Veit method of "extraction" and "manual aid" in pelvic presentations is not mentioned. In speaking of "Decollation or Decapitation" (p. (59), Parvin says: "This operation can be very quickly done by means of a piece of strong twine, which is thrown around the neck, then used as a saw, to-and fro movements given it, burying it deeper in the cervical tissues, until finally the section is completed." Children. This sentence really requires no comment. It is that the writer himself has never performed the op-thra Treated by Electrolysis."

was lacking in fine feeling, who would practice im- eration, nor seen it performed by others. It would partment of surgery. These are only a few of the sins of omission and commission, but they are suffi-

> Viewed as a whole, we regard "Parvin's Obstetfrom the American press, up to the present time; be admitted, however, that the work is very faulty.

ASSOCIATION ITEMS.

AMERICAN MEDICAL ASSOCIATION.

The Thirty eighth Annual Session will be held in Chicago, Ill., commencing on Tuesday, June 7, at 11 A.M., in Central Music Hall, corner of State and Randolph streets, and will continue four days. Good rooms for the several Sections will be provided as near the hall for general meetings as possible. Registration books will be open in Central Music Hall on Monday, the day preceding the meeting, for those who wish to register early.

In addition to the list of papers already published,

the following are promised:

Section of Diseases of Children.

C. E. Briggs, M.D., St. Louis, Mo., "On Spasm of the Larynx and (Esophagus."

L. Duncan Bulkley, M.D., New York, "On Infantile Feeding, Especially with Reference to Subjects with Infantile Eczema."

Section on Practice of Medicine, Materia Medica , and Physiology.

L. Duncan Bulkley, M.D., New York, "On the

Byron H. Daggett, M.D., Buffalo, N. Y., "On a Convenient and Practical Method of Administering

Section on Obstetrics and Diseases of Women.

Henry O. Marcy, M.D., Boston, Mass., "Cystitis in the Female."

W. H. Wathen, M.D., Louisville, Ky., "Rupture of the Uterus."

Section on Surgery and Anatomy.

Alex. Y. P. Garnett, M.D., Washington, D. C., on "The Surgical Treatment of Suppurative Pleuritis in

Robert Newman, M.D., New York, "Synopsis of utterly absurd. It presents prima facie evidence the Second Hundred Cases of Stricture of the Ure-

J. McFarland Gaston, M.D., Atlanta, Ga., "On the Pathology, Diagnosis and Treatment of Perfora-

tion of the Appendix Vermiformis."

Joseph Jones, M.D., New Orleans, La., "A New Method of Testing the Relative Value of Certain Antiseptics, Disinfectants and Germicides Employed Internally and Externally in the treatment of Wounds and Syphilis."

S. T. Armstrong, M.D., Memphis, Tenn., "Trephining in a Case of Intermingeal Hæmaturia with

Hemiplegia."

A. H. Wilson, M.D., Boston, Mass., "The Prostate Gland; a Review of its Anatomy, Pathology and Treatment."

Section on Ophthalmology, Otology and Laryngology.

J. J. Chisolm, M.D., Baltimore, Md., "The Results of a Year's Experience in the Abandonment of Eye Bandage."

W. T. Montgomery, M.D., Chicago, Ill., "After-Treatment of Cataract Extraction."

Geo. E. Frothingham, M.D., Ann Arbor, Mich., "A Case of Epilepsy Apparently Cured by Correcting Hypermetropia." "Two Cases of Tumor of the Optic Nerve."

Section on Medical Jurisprudence.

Wm. C. Wile, M.D., Philadelphia, Pa., "On Expert Testimony."

FACTS RECARDING RAILROAD RATES.

[The following letter sufficiently explains itself, which we cheerfully publish, as under.-FD.]

To THE EDITOR:

My Dear Sir: Kindly afford space in this week's issue of THE JOURNAL, and until June 4, please, by publishing the subjoined valuable information, as to those who anticipate attending the coming meeting of the American Medical Association, it will be of much practical interest-as well also, that it will be a REPLY in full to inquiries of many physicians, whose valued favors have unavoidably remained unanswered, simply because a number of our good friends have written substantially in the same manner from various parts of the country, desiring information regarding railroad rates, etc. And by your publishing a statement of the facts herein contained, it will be accepted by the Committee on Transportation as a favor personally to each of its members, and at the same time it will also be an answer to the many questions thus far received by this Committee, and which we have not had the time to respond to individually, as well as a reply to those who contemplate writing to the Committee upon the points enumerated above, and greatly oblige. Yours truly, LISTON H. MONTGOMERY, M.D.

Chairman Com. on Transportation.

150 Randolph St., Chicago, May 18, 1887

Upon all railroads within territory bounded as follows:

On the East, by the western termini of the Trunk Lines, which termini are: Toronto, Canada; Suspension Bridge, Niagara Falls, Tonawanda, Black Rock, Buffalo, East Buffalo, Buffalo Junction, Dunkirk, and Salamanca, N. Y.; Pittsburgh and Allegheny, Pa.; Bellaire, Ohio; Wheeling and Parkersburg, W. Va.; and Ashland, Ky.

On the North, by the line of the Grand Trunk Railway from Toronto to Port Hunon, including the points thereon, thence

via the Great Lakes to Chicago.

On the West, via the west line of Cook Co. 1ll. (the county in which Chicago is located) to, and via the Illinois and Missis-

on said lines and rivers, the extensions of the Wabash, and Toledo, Peoria & Western Railways westward from said boundary

as well as on the South by the Ohio River.

Delegates, members, and their families are instructed that at time they purchase their tickets going to Chicago, the Agent will furnish you with a certificate or receipt at time of said purchase, stating that you have paid full fare to place of meeting. This certificate or receipt is positively necessary for you to get from the ticket agent, which will afterwards require to be endorsed by the Chairman of the Committee on Transportation at Chicago, stating that you have been in attendance at the meeting. This will enable you to get your ticket for the return journey at One-Third the Lowest Regular Limited Fare.

In case there is no limited fare to the point desired, one-third

of the regular unlimited fare will be used.

Tickets for return journey are limited to continuous passage, and should be used on first train after they are purchased, although the certificates will be good three days after the Association adjourns. And no certificate or receipt will be honored at Chicago which was procured from agent at starting point more than three days prior to date of meeting. Thus it will be seen the certificates are good until used within the above described territory, ten days, and include all those lines that have not already been published in former issues of THE JOURNAL.

For delegates, members and their families who reside at points in Trunk Line territory (study the list of roads embraced therein) Win. Porter, M.D., St. Louis, Mo., subject not blank certificates will be furnished you by the Chairman of the Committee on Transportation at Chicago, if in good time you requisition me for the necessary number. This can be done on, and after May 24. These blank certificates will be furnished parties from points east of Niagara Falls, Buffalo, Salamanca, Pittsburgh, Petersburg or Wheeling, which will be certified to by the agent at starting-point, stating that you have paid full fare through to Chicago. It is absolutely imperative that certificates for this territory be in the hands of parties at the time of purchasing their "going" tickets, to get the ticket agent's reccipt, and will require to be endorsed by the Chairman of the Transportation Committee at the meeting, to enable the holders to get the concession returning, which will be one-third the lowest regular limited fare. These certificates are also good three days after the Association adjourns, or ten days altogether,

Regarding the Western Roads, specific knowledge cannot at this time be given as to the plan each of them will pursue, Ticket Agents for the Chicago, Milwaukee & St. Paul Railway will give each person a receipt who has purchased a ticket, stating that full fare has been paid to Chicago, This receipt will be endorsed as described above, thus cutifling the holder to return at one-third the lowest limited fare, and applies to all parties in attendance at the meeting; in all cases, however, the return rate will be made one-third the regular fare. The Chicago & Alton simply requires for its protection, a certificate as per form prepared by the "Committee," having this matter in charge, properly endorsed at Chicago, to secure the reduced fare of one-third the regular rate, etc., for each person in attendance.

The Illinois Central will also honor tickets in the same manner as will the Chicago & Alton when vouched for in the same manner.

The Chicago, Burlington & Quincy has adopted the same plan as that of the C. M. & St. P. Road.

The Chicago & Northwestern will pursue a similar plan, that of giving to each purchaser a receipt for the amount of full fare, going, as will, doubtless, most of the other lines within the territory leading west, southwest and northwest from Chicago, as far at least as the Mississippi and Missouri rivers. Tickets over the lines west of Chicago will not be honored after June 12. Negotiations are not yet completed, but from present knowledge, the indications are, that the following roads will also give the reduced rate, amounting to a fare and one-third, for the round trip to delegates and their families:

Union Pacific

Burlington & Missouri River. Atchison, Topeka & Santa Fé. Denver & Rio Grande,

Gulf, Colorado & Santa Fé.

Houston & Texas Central.

Texas & Pacific.

Missouri Pacitic. Southern Pacific. St. Louis, Arkansas & Texas.

St. Louis & San Francisco,

Iron Mountain.

Atlantie & Pacifie.

Northern Pacific.

St. Paul, Minneapolis & Manitoba.

St. Paul & Duluth.

As well, too, as the following Steamboat Lines:

Goodrich.

Lake Michigan and Lake Superior.

In all cases, except where stipulated otherwise above, it is advisable that you get from the Ticket Agent at the time you procure your tickets to Chicago, a recent from Agent, stating that you have paid full fare going, and which must invariably be shown the Chairman of Transportation Committee at place of meeting.

Upon the forty-two Southern Roads enumerated (see list), you are required to procure a certificate, similar to that required of parties who live in territory occupied by the Trunk Lines, viz., by sending to the Chairman of Transportation Committee, at Chicago, for the necessary number, etc., which you can procure

on and after May 24.

Certificates are good to return on these Southern Lines only, twenty-four hours after adjournment, i.e., good until June 11. And in every instance upon all the roads named, you are re-

quired to return the same route as upon going.

It seems as though the above information embraces every possible inquiry that can be propounded, and we trust a largely representative neeting will be held, in which we are joined by the hearty wish and co-operation of the entire profession of Chicago. Further particulars may be obtained by addressing Dr. LISTON II. MONTGOMERY,

Chairman of Committee of Transportation,

Briggs House, No. 189 Randolph St., Chicago.

The roads which will accept return tickets on the certificate plan are:

Baltimore & Ohio (west of the Ohio River), Buffalo, New York and Philadelphia.

Chicago & Grand Trunk.

Cincinnati, New Orleans & Texas Pacific. Chicago, Vincennes & Cairo Line.

Clicago & West Michigan.

Chicago, St. Louis & Pittsburgh. Cincinnati, Hamilton & Dayton.

Cincinnati, Indianapolis, St. Louis & Chicago. Cincinnati, Washington & Baltimore.

Cleveland, Akron & Columbus,

Cleveland & Marietta.

Cleveland & Pittsburgh.

Cleveland, Columbus, Cincinnati & Indianapolis, Cleveland, Loram & Wheeling.

Columbus & Cincinnati Midland.

Columbus, Hocking Valley & Toledo.

Chesapeake & Ohio.

Chicago & Atlantic.

Dayton & Ironton.

Detroit, Lansing & Northern.

Dayton & Union.

Detroit. Grand Haven & Milwaukee.

Evansville & Terre Haute.

Flint & Pere Marquette. Fort Wayne, Cincinnati & Louisville.

Graed Rapids & Indiana.

Grand Trunk.

Indianapolis & St. Louis.

Indianapolis & Vincennes.

Indianapolis, Bloomington & Western. Indianapolis, Decatur & Springfield. Jeffersonville, Madison & Indianapolis.

Kanawa & Ohio.

Lake Erie & Western.

Lake Shore & Michigan Southern.

Lousiville & Nashville.

Louisville, Evansville & St. Louis, Louisville, New Albany & Chicago.

Michigan Central.

Michigan & Ohio. New York, Chicago & St. Louis. New York, Pennsylvania & Ohio. Niagara Falls Short Line.

Ohio & Mississippi.

Pennsylvania.

Peoria, Decatur & Evansville.

Pittsburgh & Lake Erie.

Pittsburgh & Western.

Pittsburgh, Cincinnati & St. Louis.

Saginaw Valley & St. Louis,

Scioto Valley

Toledo & Ohio Central.

Toledo, Peoria & Western.

Valley Railway.

Vandalia Line.

Wabash Railway.

Wheeling & Lake Erie. Baltimore & Ohio (east of Parkersburg, Bellaire & Wheeling.)

Baltimore & Potomac

Bennington & Rutland.

Boston & Albany (on business between common points in New England and points west of, but not including Albany.)

Boston & Lowell.

Boston, Hoosae Tunnel & Western.

Buffalo, Rochester & Pittsburgh.

Camden & Atlantie. Central Vermont.

Delaware & Hudson Canal Co.

Delaware, Lackawanna & Western.

Fitchburg

Lehigh Valley. New York Central & Hudson River.

New York, Lake Erie & Western.

New York, Ontario & Western, Norfolk & Western.

Northern Central

Philadelphia & Erie.

Philadelphia & Reading.

Philadelphia, Wilmington & Baltimore.

Rome, Watertown & Ogdensburg.

Shenandoah Valley.

Troy & Boston. West Jersey.

West Shore.

The following named lines offer one and one-third fare for round trip:

Burlington, Cedar Rapids & Northern Railway.

Central Iowa Raitway.

Chicago & Alton Railroad.

Chicago & Northwestern Railway.

Chicago, Burlington & Northern Railway.

Chicago, Burlington & Quincy Railroad. Chicago, Milwaukee & St. Paul Railway.

Chicago, Rock Island & Pacific Railway.
Chicago, St. Paul, Minneapolis & Omaha Railway.
Green Bay, Winona & St. Paul Railroad.
Hannibal & St. Joseph Railroad.
Hlinois Central Railroad.

Kansas City, St. Joseph & Council Bluffs Railroad. Milwaukee & Northern Railroad.

Milwaukee, Lake Shore & Western Railway.

Minneapolis & St. Louis Railway.

Minnesota & Northwestern Railroad.

Missouri Pacific Railway

Rock Island & Peoria Řailway. Sioux City & Pacific Railroad.

Wabash Western Railway. Wisconsin Central Lines

A list of forty-two Southern roads which will accept return tickets issued under the certificate plan.

Mabama Great Southern Railroad.

Atlanta & West Point.

Brunswick & Western,

Central Railroad of Georgia. Central Railroad of South Carolina.

Charleston & Savannali.

Cheraw & Darlington. Cheraw & Salisbury

Cincinnati, New Orleans & Texas Pacific. East Tennessee, Virginia & Georgia.

Georgia.

Georgia Pacific. Illinois Central (south of Ohio River). Jacksonville, Tampa & Key West. Louisville & Nashville (south of Ohio River). Louisville, New Orleans & Texas. Memphis & Charleston. Mississippi & Tennessee. Mobile & Ohio (south of Ohio River) Nashville, Chattanooga & St. Louis. New Orleans & North-Eastern. Norfolk & Western. North-Eastern Railroad of Georgia. North-Eastern (of South Carolina). Pennsylvania (south of Washington). Petersburg. Port Royal & Augusta. Raleigh & Gaston. Richmond & Alleghany. Richmond & Danville, and leased lines. Richmond, Fredricksburg & Potomac. Richmond & Petersburg. Rome. Savannah, Florida & Western. Scaboard & Roanoke. Shenandoah Valley (south of Potomac River.) South Carolina. Vicksburg & Meridian. Western & Atlantic. Western Railway of Alabama. Wilmington, Columbia & Augusta. Wilmington & Weldon.

MISCELLANEOUS.

THE AMERICAN LARYNGOLOGICAL ASSOCIATION will hold its ninth annual session in the Hall of the New York Academy of Medicine on May 26, 27 and 28, under the Presidency of Dr. E. Fletcher Ingals, of Chicago.

Dr. Selim Pacha.—From the British Medical Journal we learn that the Khedive has nominated Dr. Selim Pacha to represent Egyptian Medicine in the approaching International Medical Congress.

Dr. Robert Barnes, of London, has been elected an Honorary Fellow of the Chicago Gynæcological Society.

THE Association of Medical Editors will meet at the Palmer House, Chicago, at 8 P.M., on the Monday evening preceding the meeting of the American Medical Association. The President, Dr. Shoemaker, will deliver an address on "Some of the Present Abuses of Medical Literature." This organization is permanent, and largely social, and it is desired that medical editors who can attend the meeting will Those who expect to be present should send their names as soon as possible to Dr. Wm. Porter, 3137 Lucas Ave., St. Louis. Dr. J. L. Gray, 70 Monroe St., Chicago, is Chairman of the Committee of Arrangements.

Kentucky State Medical Society.—The next annual meeting of this Society will be held in Paducah, on the 15th, 16th and 17th of June, 1887. Dr. W. N. Wathen, of Louisville, is President, and Dr. Steele Bailey, of Stanford, Secretary. A full attendance is expected.

The Congress and Trans-Atlantic Steamship FARES.—The London Lancet, of May 7, 1887, says: "We understand that Messrs. Henderson Bros., managing owners of the Anchor Line of Steamships, from Glasgow to New York, have decided to offer to members of the medical profession desirous of attending the International Medical Congress to assemble at Washington, in September next, return tickets to New York for £20, giving the best accommodation at this low rate."

English Society for the Study and Cure of INEBRIETY. -- The Council of this Society have called an International Congress, to be held in Westminster Hall, London, July 5 and 6, 1887, for the purpose of discussing the problems of inebriety medically. Papers have been promised from a number of eminent men in different countries, and the meeting will doubtless be a profitable and interesting one, under the Presidency of Norman Kerr, M.D., F.L.S., London. T. D. Crothers, M.D., of Hartford, Conn., is the American member of the Committee of Arrangements.

NEW YORK STATE MEDICAL ASSOCIATION.—The Fifth District Branch will hold its third annual meeting in Brooklyn, at Remsen Hall, 190 Remsen St., on Tuesday, May 24, 1887. An interesting meeting is expected.

OFFICIAL LIST OF CHANGES IN THE STATIONS AND DUTIES OF OFFICERS SERVING IN THE MEDICAL DEPARTMENT, U. S. ARMY, FROM MAY 7, 1887, TO MAY 13, 1887

Lieut.-Col. C. T. Alexander, Surgeon, granted leave of absence for four months, with permission to go beyond sea, to take effect May 23, 1887.

Capt. P. F. Harvey, Asst. Surgeon, granted leave of absence for four months, with permission to go beyond sea, to take effect June 10, 1887. S. O. 105, A. G. O., May 7, 1887.

Capt. Victor Biart, Asst. Surgeon, ordered for examination by Army Retiring Board at Ft. Leavenworth, Kans. S. O. 107, A. G. O., May 10, 1887.
Capt. F. W. Ellery, Asst. Surgeon, ordered for examination by Army Retiring Board at Washington, D. C. S. O. 109,

A. G. O., May 12, 1887.

OFFICIAL LIST OF CHANGES IN THE MEDICAL CORPS OF THE U.S. NAVY, DURING THE WEEK ENDING MAY 14, 1887.

Gravatt, C. N., Surgeon, detached from the U. S. Str. " Michigan."

Lumsden, G. P., P. A. Surgeon, ordered to the U. S. Str. " Michigan,"

Ashbridge, Richard, P. A. Surgeon, detached from the Naval Academy, and to the practice ship "Constellation, Streets, Thos. 11., P. A. Surgeon, promoted to Surgeon.

OFFICIAL LIST OF CHANGES OF STATIONS AND DUTIES OF MEDICAL OFFICERS OF THE U, S, MARINE HOS-PITAL SERVICE FOR THE WEEK ENDED MAY 14, 1887.

Fessenden, C. S. D., Surgeon, detailed as chairman of Board for physical examination of cadets, Revenue Marine Service. Máy 13, 1887.

Stoner, G. W., Surgeon, to proceed to Delaware Breakwater as inspector, and to New York and Philadelphia to inspect unserviceable property. May 12, 1887.

Irwin, Fairfax, P. A. Singeon, detailed as recorder of Board

for physical examination of cadets, Revenue Marine Service. May 13, 1887. Fattic, J. B., Asst. Surgeon, relieved from duty at Baltimore,

Md.; ordered to Marine Hospital, St. Lonis, Mo. May 13,

THE CURE OF HERNIA.

Read in the Section on Surgery at the Thirty-seventh Annual Meeting of the American Medical Assocition, May, 1886.

BY HENRY O. MARCY, A.M., M.D.,

OF BOSTON, MASS.

Temerity born of ignorance would seem the only judgment to be passed upon one who would offer any further contribution upon the cure of hernia. The eighty closely printed quarto pages of the "Index Catalogue" of our National Library, giving only titles and authors, would presuppose an exhausted subject. the cure of hernia has remained in large degree an unsolved surgical problem, and the sale of supports and trusses increases with each decade. This paper is of narrow limit and has but the one definite ob-

quoted by Mr. Spanton in 1881, as referable to Great Britain, "the mean annual rate of mortality for the year 1879 was 45 deaths to every 1,000,000 living; and to make the significance of this more manifest, or two other cases. In 1878, I reprinted from a I may point out that while calculus killed 237 per-communication offered to the Association, a paper sons in the year 1879, and all malformations (except giving a considerable series of eases and a study of spina bifida) put together, 219; gout 662; and all the histological metamorphosis which tendinous structure diseases only 1,068, hernia caused the death tures undergo when incorporated into the tissues. of 1,119 in the same period." Table II shows that out of 1,870 cases of operation, in hospitals, etc., for human subject in which I had operated some months strangulation, there occurred 782 deaths, giving 41.80 previous and death had supervened from acute disper cent. of mortality. This has been greatly les- ease; also a series of studies upon rabbits and pupsened by modern methods of wound treatment, but pies. In 1881 I communicated to the International the injury to the intestine by the constriction still Congress in London further observations upon the remains a danger to the patient, often far exceeding same subject, with a list of cases, and emphasized those incident to operative measures. We can do the removal of the peritoneal pouch as important in no less than second with all earnestness the plea so preventing return of the affection.

ably set forth by Mr. Spanton in England and Dr. Joseph Warren in America, to effect by operative measures a cure in a large class of these sufferers. especially in the young, rather than condemn them to lifelong discomfort from support and a perpetual risk of disability and death. The revolution in abdominal surgery, during the last decade, renders less imperative the need of enforcement, by argument, of proper antiseptic precautions by which peritoneal wounds are rendered almost devoid of danger; rules enforced in my earlier writings upon hernia, as a duty of religious exactitude; now, however, like the church dogmas, accepted in theory, but obeyed with a laxity which brings discredit upon the faith.

The etiology and causation of hernia cannot even Notwithstanding, from the Fathers to the present, be referred to here; but the fact that about one-eighth of the entire number occurs in childhood, renders it probable that a congenital lack of proper development is a fundamental factor in its production.

My first operation for hernia which involved the ject—that of teaching a single method of cure which essential principles now advocated was done seventhe writer would commend in operative cases; yet, teen years ago. The year previous, I had returned the importance of the subject demands brief notice. from Edinburgh, a convert to the teachings of Prof. Although hernia in all classes and ages, from in- Lister. The omentum with a loop of the intestine fancy to old age, is a matter of daily observation by our profession, the statistics of Dr. J. H. Baxter, and the patient was in extremis. The hernia was old, giving 5 per cent. of the total population as subject the ring large, the pillars weak; and the patient, adto such a disabling and dangerous affection, will surprise most who are not special students of the subject. This gives nearly three millions of people, of all ages and conditions, in the United States alone, were stitched together with large catgut sutures and were stitched together with large catgut sutures and supprise means a large time ring range, the pinals weak, and the patient, authorized in years, had a very troublesome bronchial cough. The operation was antiseptic in method, and, owing to the cough, the deep pillars of the ring were stitched together with large catgut sutures and the means alone. who are sufferers in a greater or less degree from this the wound closed, to prevent a prolapse of abdominal affection. One English firm manufactures over 50, contents, rather than with any thought of cure. The ooo trusses a year, chiefly for home supply. As cough continued severe until the patient's death, six

There can be no doubt but that many cases which and closing from the very bottom the walls of the are reported cured by any of the various methods of operation, in the end prove failures; since a very considerable period must elapse before one can be been of indefinite duration. I have operated upon at all sure of results. This should cause hesitation every variety of hernia, and with considerable modiin tabulating cases until they have continued for a fication of detail. The usual method is simple and considerable period under observation. Only re- is outlined as follows: A careful shaving and cleanscently have I seen a case of double hernia, where I ing of the external parts, using carbolic acid or merwitnessed a very skilful operation by injection, and curic bichloride solution. Soap containg ½ of 1 per examined the patient with great care one year after cent. mercuric bichloride is very convenient. Each without detection of a weakening ring; but now, four step of the operation is taken with strict antiseptic years having elapsed, the hernia has returned, and detail, usually under irrigation. If the abdominal the patient must again resort to a truss. I am led cavity is opened spray is used. In inguinal hernia, to believe that, in a very considerable class of cases in no instance have I made the incision in the scroreported cured, especially in the blind operations of tum as advocated by Mr. Wood, and it is usually parsubcutaneous sewing and injection methods, the her- allel with Poupart's ligament and a little, perhaps half nia returns, because the deeper tendinous structures an inch, higher on the abdominal wall than the openremain unclosed and the peritoneal sac unobliterated. ing through the ring. The elasticity of the tissues Since the days of Morgagni, it has been repeatedly allows of easy manipulation of the parts, and brings claimed that hernia was often produced by the elon- the external wound a little way from the fold of the gation of the mesentery and a consequent prolapse groin, which facilitates a safer dressing and causes of the intestines. This error is repeated even in our less irritation in the subsequent wearing of a support. best text-books: as, for example, Bryant. The fre- The incision should be free and sufficiently long to quency with which the small intestines are found, at insure easy inspection and ample room. Secure, of autopsies and in abdominal operations, in the pelvic course, any vessel which bleeds—and yet, my expecavity, would refute this supposition.

entery of the jejunum on the left side longer and vantages of the open method, enabling the surgeon nine to ten inches. In the right iliac fossa, at the the sponge, the parts became so bleared with blood, lower part, the mesentery attains only about one-half that I was obliged to rely mainly upon the sense of this length. In one case out of the hundred exam-touch, before I ventured to pass a needle through ined, Mr. Treves found the intestines, in a woman of Poupart's ligament, the conjoined tendon, or the piltrue that, in a majority of cases, the small intestines done by me, when the sac to be removed is not very find easy lodgment as low as in the pelvic basin, the large, through a scrotal incision two inches long bearing of these considerations upon the cure of reaching up to the superficial ring." hernia becomes apparent. The pinching of the peritoneum over a weakened ring gives an effective extent, draw up the peritoneal pouch quite sufficient lodgment of abdominal contents. The elongated to cause its obliteration upon the inner side and sew omentum is continually slipping into the depression it evenly with fine tendon sutures by the so-called and acts as a wedge, driving the supporting walls shoemaker's stitch. This encloses all the peritoneum apart, and often cases occur where it is wiser to re- and occludes it, while it has the advantage of a double move an elongated, thickened mass rather than to thread and only one knot. Then cut away the rereplace and leave it to act as a future source of dundant pouch and allow the peritoneum to drop trouble. In a number of cases, I have removed back, in order not to include it in the deep suturing considerable portions of omentum, for this reason, of the tendinous structures. In some cases, where without bad result.

only refer to the inguinal canal, as a passage from the porated it in the deep suturing, as a reinforcement to deep to the superficial ring, one and one-half to two the tissues. However, I can but regard this as a inches in length, doubly oblique in direction, and doubtful measure; usually I have felt it wise to reclosed in a valvular way, by close apposition and by fresh the pillars before suturing as more likely to connective tissue attachment of its walls. In congenital cases, the tunnel-like projection of the peritoneum of pre-natal formation has not been obliterated, Cure is effected by obliterating the peritoneal folds thickening of the peritoneum, over which normally

rience does not confirm Mr. Wood's views in his Mr. Treves' observations are of much interest in recent lectures published in the British Medical Jourtheir bearing upon this subject. He found the mes- nal.2 He says: "With respect to the supposed adlooser at a point from six to ten feet from the duo to see the parts on which he operates, I have myself denum. Here the mesentery attains a length of from found that, after the first cut and the application of 70, could be drawn down eight inches below the crest lars of the ring. My experience is that this operaof the ileum, and yet there was no hernia. If it is tion can be all done, and has been very frequently

Having divided the external tissues to a sufficient the ring has been very large and the pillars much at-Interesting as is the anatomy of hernia, we can tenuated, I have folded the sac upon itself and incorsecure a firm union. The method of Mr. MacEwen, of suturing the peritoneal pouch in such a manner that it can be introflected upon itself—pursed up, so and the walls of the canal have become stretched and to speak—is, to say the least, ingenious; but it aptorn, until the valvular action of the canal is lost, pears open to the objection of making an obstructive

Dr. Poring of the large pedicle of nterine myoma and in the excision of the uterus. The needle is set in a firm handle and is without a cutting point, with the eye near the end. A half to three-quarter curve is preferable. The needle, threaded, is introduced, and the end unthreaded, the opposite end is threaded and withdrawn; this is continued until the seam is complete in as many and as fine stitches as may be thought best. A little care is necessary not to overconstrict the tissues and thereby cause necrosis. I have deemed this method of sewing important, since the great objection to the animal suture is the knot, which in this way is reduced to one, no matter how many stitches are required. Moreover, thus applied, the pressure on the enclosed tissue is equalized and injury therefrom reduced to a minimum; and if it is true, as my experiments lead me to believe, that the tendon suture is replaced by a proliferation of connective tissue, this method of reinforcement is doubly important. I have also used with satisfaction the over and over suture with the Hagerdorn needle, which possesses certain advantages now well known to the profession. A twisted horsehair is generally used for drainage, and the external wound closed by a fine continuous suture. Iodoform dressing is careis advised to be worn for some months, but too much other methods. pressure is injurious.

when properly done, in the great majority of cases, the cure will be permanent.

A brief review of our literature will show that the procedures involving the abdomen and its contents, struction, subcutaneously wired the rings together,

The first case of cure reported in Great Britain was by Mr. Charles Steele, of Bristol (British Med-The proliferation and repair of the tendinous ical Journal, November 7, 1874), three years after The stitches are repeated at distances of of the sac; also Prof. Buchanan and Sir William

> Prof. MacEwen, of Glasgow, reported cures in ter, of Boston, reports two cases thus cured, also L. Champonnière, of Paris, and others.

> Subcutaneous wire suturing is of very ancient date. It fell into disuse and was condemned as dangerous, until within the present generation. Prof. J. C. Nott published a case of cure in 1845 from the use of the lead suture. Prof. John Wood, of London, a quarter of a century ago received a prize for an essay on the cure of hernia. His method is a subcutaneous closure by wire, the originality of the method dependent upon the way of introducing the wire. The remarkable skill of the operator, together with the shape of the needle, enabled Mr. Wood to secure and occlude the canal.

In that day, when septic infection of wounds, in hospitals, was the rule rather than the exception, subcutaneous surgery, even if blind, bungling, and imperfect, was commendable. With the record which Mr. Wood presents of a majority of cures, it is no wonder that he still, in large degree, advocates his methods, and it is very creditable to his spirit of enterprise that he is willing to adopt the tendon suture, instead of wire. "Latterly," he says, "I have used a stout piece of kangaroo, deer, or ox tendon, well antisepticized in carbolized oil, and softened fully applied, but the great danger is the infection of just before using by soaking it in 1 to 40 carbolized the wound during manipulation rather than after its lotion. The advantage of this is, that there is no closure. Care to avoid over-strain should be exer- necessity for disturbing the wound by the removal of cised for a considerable period, A water pad truss the buried suture, as in the case of the wire and

From this it is apparent that he recognizes only The above procedure is simple, effective, and safe; the coaptation and constriction of the ligature, and not the re-enforcement claimed by the development of surrounding connective tissue.

The late Dr. McDowell, of Texas, by an equally operative measures for hernia, like all other surgical ingenious method, using a needle of peculiar con-

and reported a large percentage of cures. Shortly before his death he informed me that, in his judgment, his operation left little to be desired. Mr. Spanton, whose paper has already been referred to, has devised an ingenious modification of subcutaneous suturing, combining the needle and constricting material in the same instrument, which closely resembles a cork-screw. This is introduced so as to incorporate the rings, and is left for a period of time sufficient to secure a large exudative mass about the ring, and is then withdrawn. No serious results have followed the operation in his hands, and he reports a very large percentage of cures.

Boston, is the world-wide known advocate, aim at a somewhat similar result. A very large exudation into the surrounding tissues follows, and undoubt-

edly many cures have thus been obtained.

The criticism pertains, in a large degree, to all these subcutaneous methods, that they belong to blind surgery; at the best, depend upon the tactile sense which, cultivated by the long experience of a Wood or Warren, may be trustworthy; but an operation which is to become general must be based upon a few simple, well understood factors, to be safely entrusted to the general surgeon. Prof. Tilanus, of Amsterdam, reported to the International Congress of 1878 a collection of 100 cases by Continental operators, by the open method of dissection, for the cure of hernia, both under and without antiseptic precautions, with a mortality of about 11 per cent. Prof. Annandale, of Edinburgh, has more recently reported 71 cases with 4 deaths, by various operators, but all under antiseptic precautions; 66 cases are claimed as cured.

The inaugural Thesis of Victor Cuenod, published in Lausanne in 1881, gives a detailed list of the cases operated on by his master, Prof. Socin, of Basle. He tabulates 34 cases, all of which were under repeated observation during many months; 22 cases remained cured, twelve failed in from six weeks to twenty-two months. He attributes failure, in most cases, to imperfectly prepared catgut and silk; following the use of the latter were very troublesome abscesses, although the silk was carbolized. In the entire list of failures (and the cases were all improved) there was not a single death. The catgut which was chromocized, or prepared in oil of juniper, proved satisfactory. The method was the open dissection with deep suturing of the pillars of the ring, under careful aseptic care and dressing.

In thirty operative cases recovery followed without serious symptoms. I have had two deaths; one a strangulated umbilical hernia, where I removed seven inches of gangrenous small intestine and joined it with a double row of fine tendon sutures. Death ensued about seventy hours after, from exhaustion, as the most probable cause, since there was no peritonitis and the edges were agglutinated by lymph exudation, so that the closed section held water. The other was a case of strangulated crural hernia, where the autopsy showed a slough of the returned con_ stricted intestine, with the escape of its contents. These two cases are thus fairly excluded from the list.

In conclusion, I would advise operation by the

- 1. In all cases of operation for strangulation.
- 2. In all cases where the abdominal contents are imperfectly retained by an instrument, unless the age and condition of the patient prevent.
- 3. In that large class of children when the conditions do not warrant a spontaneous cure.

This opinion is based upon the rigid enforcement of the aseptic principles of operative wound treatment.

The injection methods of which Dr. Warren, of THE USE OF A PLUS CYLINDER IN SIMPLE MYOPIC ASTIGMATISM OF LOW DEGREE:

And the Occasional Necessity for Changing the Axis of the Cylinder for Distance to a Different Axis for Reading.

Read before the Chicago Society of Ophthalmology and Otology, February 8, 1887,

BY W. FRANKLIN COLEMAN, M.D., M.R.C.S., Eng. PROFESSOR OF OPHTHALMOLOGY AND OTOLOGY, CHICAGO POLICLINIC.

Errors of refraction assume so many forms and are so variously treated that I could wish very much to hear the whole subject discussed. This evening I wish to give examples of two classes of cases, in one of which I have more recently adopted a method of treatment, the merits of which entitle it to more general recognition. These are cases of simple myopic astigmatism of low degree (say $\frac{1}{40}$ to $\frac{1}{12}$). Whether they be due to spasm of accommodation or not, I am inclined to think it would always be best for near vision to substitute a plus cylinder, with its axis at right angles to that of the minus cylinder found for distance.

Dr. Culbertson asserts that in non-spasmodic myopic astigmatism, a plus cylinder used as just stated will, in many instances, correct the ametropia, and he proceeds to illustrate the manner in which the ciliary asthenopia is relieved by the plus glass. I will quote only one passage as a sufficient reason for not coinciding with his explanation. He says: "By this minus glass for distance, the myopia in proximal vision has been simply transferred from one to the other plane, and the foci of the two planes are not of the same length." Now if an eye is made emmetropic for remote vision (by correcting its myopic meridian or otherwise), it is certainly emmetropic for proximal vision, and the foci of all the meridians must then be of the same length; and it will require accommodation only to receive a clear image of the near objects.

The reason of the advantage of a plus cylinder does not seem to me far to seek. The total accommodation (not "the unequal contraction of the ciliary muscle") is relieved by a plus glass. For example: Let us suppose an eye with a myopic astigmatism in the vertical meridian of 2.D (or $\frac{1}{20}$) to be corrected by a — 20c axis 180°, and now without accommodation to be adapted for remote vision or parallel rays. If the object be brought to 20" and

American Journal of Ophthalmology, October, 1885.

a + 20s glass be placed before the eye corrected with the cylindric glass, the eye will still receive parallel rays, and, hence, an image without the necessity E. + 60s + 60c 90° prism 2° base in. for accommodation. It follows that at whatever proximal distance the object is viewed with this + 20" glass the ciliary muscle is relieved, an effort equal glasses all day, for near work, with perfect comfort. to + 20'' (or 2.D). Now the combined + 20s -20c axis 180° is equal to a + 20c axis 90°.

the additional reason that it gives a larger image. Again, as in myopes, the ciliary muscle of the astig-if possible, the less efficient homatropine. matic myope may be reasonably supposed to be case (of Mrs. R.), it seems to me, shows that spasm poorly developed and unequal to ordinary use. In of accommodation produced a myopia of $\frac{1}{48}$; and other words, I would not give a weak minus cylinder | changed a hyperopic astigmatism of $\frac{1}{60}$ into a myoin myopic astigmatism, for the same reason that a pic of $\frac{1}{48}$, by advancing the focus of the hyperopic weak minus spherical is not given in myopia for meridian to the retina and the focus of the emme-

reading.

stance (not a few) the plus was preferred. That is, glass for near work. with the latter the type was more distinct and readcally to be true the test of trial has verified. It is this: A simple myopic astigmatic (1) might read 1 Jaeger at 12" imperfectly; (2) with a + spherical glass would read it still better; (3) with a minus cylinder still better; (4) and with a plus cylinder at right angles to that required by the minus the type could be read best and perfectly. In (1) the astigmentioned. I will cite a few cases in illustration:

Case 1.—Hortense H., &t. 13, has had during the tivitis, and the edges of the lids have been red and swollen. After recovery from the conjunctivitis,

Under atropine R. E. V + 36c $180^{\circ} = \frac{20}{20}$. Under atropine L. E. V - 36c $90^{\circ} = \frac{20}{30}$. With accommodation R. E. V - 48c $90^{\circ} = \frac{20}{30}$. With accommodation L. E. V - 36c $90^{\circ} = \frac{20}{30}$. R. E. V = 1 J 12" with - 48c $90^{\circ} = 1$ J 12", better. with $+ 48c \, 180^{\circ} = 1 \, \text{J} \, 12''$, best. L. E. $V = 1 \text{ J } 12'' \text{ with } -36c \text{ } 90^{\circ} = 1 \text{ J } 12'', \text{ better.}$ with $\pm 36c \ 180^{\circ} = 1 \ \text{J} \ 12''$, best.

+ 36c 180°.

Three months subsequently the lids recovered, and the patient prefers reading with the glasses, which completely relieve her of asthenopia.

Case 2.—Mrs. R., æt. 21. Since childhood her eyes have been more or less red and sore, and she has been unable to read, sew or paint longer than card. ten minutes at a time without straining her eyes.

R. E. V = $\frac{20}{20}$ = 1 J 12" with difficulty. L. E. V = 48s = 48c 180° = $\frac{20}{20}$ = 1 J 12" im-

perfectly.

L. E. V \pm 48c 90° = 1 J 12" better but imperfectly.

Under homatropine R. E. $V = \frac{20}{20}$ (Em). L. E. $V = \frac{20}{20}$ with $\pm 600 \, 90^{\circ}$.

At 20' adduction = 10° , abduction = 6° .

A month later all redness of the conjunctiva had disappeared. Mrs. R. can use her eyes with the

At one time I seldom used atropine in testing refraction, but mistakes convinced me of the errors of This + 20c is perhaps preferred to the - 20c for my ways; and now I get the full effect of atropine whenever practicable, and when not so I substitute, tropic meridian to $\frac{1}{40}$ in front of it; showing an ex-Formerly I prescribed the minus cylinder, which cess of ciliary contraction in the vertical meridian of the patient certainly preferred to astigmatic vision, the muscle $=\frac{1}{48}-\frac{1}{60}$. Dobrowolsky has demonand as a rule was satisfied with the improvement as strated that this unequal contraction of the ciliary compared with no glass. Recently I have given the muscle sometimes occurs. The case illustrates also option of a plus or minus cylinder, and in every in- the necessity of a mydriatic to determine the best

Case 3.—Mrs. W., tet. 36, is unable to read longer ing more comfortable. What I supposed theoreti- than fifteen minutes without feeling her eyes fatigued.

R. E. V —10c 15° or + 18c 105° = $\frac{2.0}{6.0}$ = 1 J 8". L. E. V —10c 165° or + 10c 75° = $\frac{2.0}{6.0}$ = 1 J 7". With the above plus glasses the patient read for

an hour without any inconvenience, and they were ordered.

In this case, with the accommodation active the right eye accepted for distance a plus 18 cylinder, matic image is indistinct; in (2) the astigmatic image and apparently by unequal ciliary contraction (the is magnified; in (3) the image is clear; in (4) the excess = $\frac{1}{10} - \frac{1}{18} = \frac{1}{22}$) the eye also accepted a corrected eye, the image is also clear and larger. — 10 cylinder with axis at right angles to the former, This I think is preferred for the reasons previously and vision was the same with either glass. Here even in so high a degree of myopic astigmatism as 1 a plus glass is preferred for reading. Granted past year frequent attacks of phlyctenular conjunc- that the myopic astigmatism occurs during active accommodation and is probably spasmodic. In the left eye the change of a hyperopic astigmatism of $\frac{1}{10}$ to a myopic of $\frac{1}{10}$ is easily due to a ciliary contraction equal to overcoming a minus 10 spherical lens.

Case 4.—Miss S., æt. 16, was sent to me October 7, 1886, by her physician, on account of her headaches, which he thought had some connection with an error of refraction. Miss S. is a large, rapidly growing, neurotic, and not very vigorous young lady, who has suffered daily from headache since Glasses were ordered R. E. + 48c 180°; L. E. childhood, and during the past two years she has been unable to read longer than twenty minutes without pain in her eyes and forehead, lachrymation, and blurring of the type. The eyes have been painful also several times during the day. They are sensitive to pressure.

R. $V = \frac{2.0}{4.0} = 1 \text{ J } 12'' + 48 = \frac{2.0}{4.0} = \text{astigmatic}$

L. $V = \frac{20}{36} = 1$ J 12", refuses any glass. At 6' (adduction = 13) V. $d = 8^\circ$ divergence.

Upon fixation within 12" the eyes diverge.

After atropine three days R. $V + 36c_{90}^{\circ} = \frac{20}{30}$. L. V + $36c 90^{\circ} = \frac{20}{30}$. At 8' adduction 24', abduction 15°.

V $-36c \text{ r80}^{\circ} = \frac{20}{30}$; L. V $36c \text{ r60}^{\circ} = \frac{20}{30}$.

bility to read remain the same. The headache is These glasses were ordered. not relieved.

utes with + 48s oprism 2° base out or in before to consult Dr. H. Derby, of Boston, as he wished

with comfort, and equally well with the adducting prisms or with the + 36s glasses. Was told to try reading on alternate days with the prisms reversed, or bases in, and the 36s as before.

Six weeks later. Now reads fifty-four minutes with ease, and equally well with either pair of glasses. The headache is not relieved.

With accommodation R. V — 60c $180^{\circ} = \frac{20}{30}$. L. V — 60c $180^{\circ} = \frac{20}{30}$. R. or L. V = 1 J 12'' + $60 = 1 \text{ J } 12'' \text{ better} - 600 \text{ } 180^\circ = 1 \text{ J } 12'' \text{ still better,}$ $+ 600 90^{\circ} = 1 \text{ J } 12'' \text{ best.}$

shown at 20 feet and adduction $= 24^{\circ}$, abduction = 6° , V. D = 4 convergence.

After atropine (grs. viij and 3j) six times in two be the best reading glasses. days, R. V + 48 + 600 90 = $\frac{20}{30}$. L. V + 48 +60c 90° = $\frac{20}{30}$. Was given prisms 2°, 6°, 8°, 10°, 12°, with which (by combining) to exercise the internal and external recti muscles.

Case 5.—Countess de B., æt. 35. Asthenopic. With atropine R. V — 16s — 48c 90° = $\frac{15}{30}$. L. V — 16s — 48c 90° = $\frac{15}{30}$. These glasses were ordered for distance. With accommodation intact R. or L. V — $48c 90^\circ = 1 \text{ J } 12''$. These glasses were ordered for near work. In a month the patient reports the glasses afford great relief, but her eyes still tire in reading. Her ladyship is advised to rest near work was usually done within sixteen inches.

Case 6.—J. H. B., æt. 20, school teacher, seen in pain in his eyes whenever he read for five minutes. R. V + $48c 90^\circ = \frac{20}{20}$. L. V + $48c 90^\circ = \frac{20}{20}$.

With these glasses he read half an hour with ease. In February Mr. B. reports: A little reading affects the left eye for two to three days; and in Sep- is not mentioned so far as I have seen in literature.

with which he reads without any unpleasantness for whether the phenomenon is rare. If an eye is tested an hour and a half.

At 12' adduction 45°; abduction 24; V. d = 12° that the last glasses relieve him more than the previous ones. Still he can read only ten minutes October 14.—With accommodation restored R. without pain in the left eye. Under homatropine, R. V — $300 \cdot 180^{\circ} = \frac{20}{20}$. L. V $300 \cdot 180^{\circ} = \frac{20}{20}$. When November 14.—After constant current of elec-accommodation was restored abducting prisms of 2° tricity to the eyes daily for two weeks, the tender-leach were added to the above glasses. With these ness of the eyes is much less, but the pain and ina- Mr. B. reads one and a half hours comfortably.

Nine months later: "I can use the spectacles if November 19.—Upon trial can read only five min- I do not look away from the book." Recommended further advice.

Nine months later Mr. B. said Dr. Derby pre-

Case 7.—Frank F., æt. 12, complains that his eyes half the maximum time attained and increase as beget tired in five minutes reading. R. V — 42c 90° fore. Prescribed arsenic and fat food.

Three weeks later. Reads twenty-seven minutes $2 \int 5''$ to 12''.

Under homatropine, R. V — $36c 90^\circ = \frac{20}{20}$. L. V $-600 90^{\circ} = \frac{20}{20}$.

At 20', convergence = 15°, divergence = 5°. With accommodation, R. V = 36c $90^{\circ} = \frac{20}{20} =$ 1 J 8". L. V — $600 \ 90^{\circ} = \frac{20}{20} = 1 \ \text{J 6}$ ".

Read with these glasses comfortably for one hour. A month later Frank reports the eyes give him no trouble in reading. In this instance the astigmatism of the right eye is less before than after the mydriasis, and that of the left eye greater. The crystalline astigmatism of the right under accommodation may For the first time in testing binocular vision is compensate for that of the cornea, as Donders pointed out is usually more or less the case. It is noticeable that the findings under homatropine prove to

> Case &.-Mr. R., æt. 37; anditor; asthenopic. Under homatropine, R. V + 36c $75^{\circ} = \frac{20}{30}$. L. V $+ 36c So^{\circ} = \frac{20}{20}$

> Two days later, with restored accommodation, R.

 $V - 36c \text{ 180}^{\circ} = \frac{20}{20}$. L. $V - 36c \text{ 170}^{\circ} = \frac{20}{20}$. R. V = 1 J 12" with difficulty, + 36s better, — 36c 170° still better, + 36c 75° best and well. L. $V = \tau J \tau 2''$ with difficulty, + 36s better, -36c 170° still better, $+36c80^{\circ}$ best and well. The above + cylindric glasses with which the patient could read best were given.

A year later Mr. R. says he likes his glasses very her eyes when they get tired. Possibly a + 48c much, and is quite relieved of asthenopia. In this 180° might have afforded more relief, especially if case the right eye prefers for reading the + cylinder at an angle of 75°, which was accepted with paralyzed accommodation. This glass varies 15° January, 1882. During the past six months has had the same glass that would have been selected for reading by the oculist from the result of testing remote vision with accommodation intact.

This change in the axis of the cylinder determined for remote vision to a different angle for near vision, tember presents himself, saying he can read comfort- After first noticing this peculiarity I looked for other ably with the glasses for only fifteen minutes... THE IMPORTANCE OF HYGIENIC MEASURES IN THE TREATMENT OF NASAL CATARRH.

BY THOMAS F. RUMBOLD, M.D., OF ST. LOUIS, MO.

Chronic catarrhal inflammation of the mucous membrane of the nasal passages and the cavities men arose from the results of excesses of various connected with them, requires a very different management from that given to other diseases, for the and stimulants. In the case of women, their sickreason that the effects of dress, customs and daily ness and death arose from the results of exposure of habits of patients have a controlling influence on various kinds, but principally owing to insufficient

tients for catarrhal inflammation of the throat and is as far from being flattering to woman's judgment nasal passages. They were in the habit of frequenting a skating rink from two to four nights each week. on effects of inclement weather. One is an evi-After exercising violently they became exhausted dence of a determination not to be deprived of any and seated themselves on a bench in the cold air, pleasure at whatever cost, and the other denotes thus becoming chilled. I was but partially success-either a great state of ignorance or an indifference

it would be well to test the effect of changing the being unable to do more than alleviate their most prominent symptoms, and these only temporarily. These circumstances led me to consult a record I had kept of the history and treatment of a few obbeen unable for twelve years to read more than half servant patients who had, at different times during the five years previous, been under my care for the pain in her eyes. After homatropine, R. V + 60c same complaint. These last named patients had $+ 36c + 15^{\circ} = \frac{20}{20}$. L. V + 60s $36c + 165^{\circ} = \frac{20}{20}$. In the last named patients had noted many of their symptoms and had taken special pains to maintain their general health. I made a record of these cases at different times, but had not, The patient can read only five minutes with the until on this occasion, read them through in succession. After a careful reading and comparison one with another, I was struck with the marked similarity of their statements regarding the causes they ascribed to the aggravation of their catarrhal complaint. The similarity did not end here, but included the care In this instance the axis of the reading cylinder that experience had taught them to take of themvaries 15 from the axis of the distance cylinder de-selves; the amount as well as the kind of clothing termined with the right eye under homatropine, and that proved sufficiently protective, and the best varies 30° from the axis determined with active means they found to relieve a fresh attack of cold in

The reading of this record deeply impressed me this complaint according to our text books), to do The change in the reading axis we might assume more than give a little relief, proved to me that the renewal of the cause of the inflammation, namely, colds. It was not difficult now to see why I had failed in the "skating-rink cases." Since that time I have made it a point to require my patients to strictly observe the laws of hygiene. If they do not do so, I discontinue the treatment at once.

In 1868, I made a series of observations concerning the causes of sickness and death among men and women between the ages of 20 and 40 years. I soon found that most of the ailments and deaths of kinds, and the chief of these, was the use of tobacco both the production and prevention of the complaint. clothing. While this is far from being complimentary In the early part 1868, I treated a number of pa- to man's strength of will to control his appetites, it ful in the treatment of their catarrhal complaint, to a very common cause of disease and death.

Every physician who expects to treat chronic ca- patients take such care of themselves, by proper attarrhal disease of the nasal passages successfully, tention to their dress, habits and daily customs as must keep in mind the proneness of male patients will lessen to a great degree the severity of recurrent to commit excesses, and the certainty that almost colds, the disease cannot be controlled by either every female patient is insufficiently and imperfectly local or constitutional treatment, or by both. It is

permanent a recovery as possible; but with those suffering from catarrhal inflammation of the nasal passages, this assistance is absolutely indispensable; a recovery without it is impossible. A majority of laws. these patients appreciate this, when the subject is of many of the details of the laws of health, or they do not consider them of sufficient importance to give them strict attention. For this reason each patient should, on his first visit, receive instructions on such hygienic laws and sanative measures as are suited to his particular case. These instructions should refer to the following points of conduct:

The importance of avoiding any exposure liable to produce a cold; the best method of protecting the head, neck, body and extremities; the danger of exposure to night air; the course to pursue when a cold has been taken; the proper temperature and ventilation of the sleeping room; the kind of food that should be used; physical exercise and the time it may be taken; the injury resulting from not controlling a gloomy mind and an irritable disposition; the danger arising from cold feet and the way to maintain them warm if they are habitually cold; the necessity of maintaining the nasal and aural passages free of catarrhal secretion, and the most effective and non-irritating means to be employed; the kind of bath that may be used and the manner and time in which to use it; the necessity of abstaining from the use of tobacco and stimulants; the importance of having diseased gums and decayed teeth properly treated by a dentist, and any other hygienic and sanative measures that will tend to regain and preserve health. It will seldom happen that any one patient will need to be instructed in all of these matters, but the greater portion of them must be given to every patient.

The successful treatment of chronic catarrhal inflammation of the superior portion of the respiratory tract, may be likened to the successful suspension of a chain. If any one of its links is broken the chain drops. So with the treatment of this disease. It may be said that one link of the chain is called protection of the head, neck, body and extremities; another link, danger of draughts to night air; another, injury resulting from not controlling an irritable disposition and a gloomy mind; another, abstainance measures. Two other links belong to this chain, namely, therapeutic and operative measures. If any whether it be the patient's or the physician's fault. My of health. experience leads me to affirm positively that unless

only during the observance of hygienic and sanative Patients suffering from any kind of disease should measures that therapeutic measures can be successso assist their physician as to insure as speedy and fully employed. It should not be expected that a chronic disease originating solely from repeated violations of the laws of health, can ever be ameliorated while the patient continues to violate these

It is a characteristic of chronic nasal catarrh to fully presented, but the most of them are ignorant establish a susceptibility to renewed attacks of cold in the head. That is, past colds have so weakened the mucous membrane, that it becomes inflamed on the patient being but slightly exposed, while at an earlier stage of the complaint, or when it was still in the acute form, this exposure would not have produced an injurious effect. In the still more chronic stages, the patient will often realize this important but very unpleasant fact. Past experience proves that in the treatment of patients who have been afflicted so long as to acquire this character of susceptibility, the dependence upon medicines alone must result in failure, as it is evident they cannot ward off colds. This is to be done by conforming to rules pertaining to the general health. But it is equally evident, that the observance of these rules cannot give immediate relief to an irritation caused by morbid secretion, or to a pain occasioned by a local congestion; this relief must be the result of remedies locally applied.

Such therapeutic and operative measures must be instituted as will prevent the continuance of the diseased action already set up. If the therapeutic measures are non-irritating and alleviating, and the patient lives in conformity to hygienic principles, the reparative processes of nature will, in a longer or shorter period of time, according to the age and temperament of the patient, restore the inflamed membrane to its normal condition, or to such a condition that the patient will not be conscious of the existance of the disease. Of course it would be preposterous to think that this restoration could be effected in a few weeks or even in a few months, except in young persons. The changes in the mucous membrane, the result of long standing inflammation, are too great for a cure to be effected in so short a time. Time was required for the congestion to produce the disease, and time will be required for the reparative processes of nature to undo or eradicate it, that is, proper care, non-irritative therapeutic measures and time will do it. For this reason, the strictest observance of hygienic measures must not from the use of tobacco and stimulants; and so on cease with the termination of medical treatment, through the whole list of hygienic and sanative but must be continued for several years thereafter, or so long as there is susceptibility to take cold. Some patients complain of the severity of thisone of these links is broken, it matters not which what they call—rigid mode of life. Can any man or one it is, the chain is broken and falls, and the at- woman give a good reason for not living continually tempt to bring about a recovery is unsuccessful, in conformity to well-known and easily obeyed laws

From the foregoing it will be readily perceived,

that, according to the writer's views, the observance impossible to modify these conditions by local treatof hygienic measures is of far greater importance to ment, at the same time that we act upon the capillathe successful issue of a case than are therapeutic ries by the internal administration of ergot. At all measures. From close and careful observation ex- events, only a small percentage of myomata endanger tending back to 1862, I am satisfied that more can life from any cause whatever, and a plea for an early be done for these sufferers—including all ages—by operation cannot possibly find a logical foothold in the proper observance of hygienic measures alone, these cases. In rapidly growing cysts, which endanthan can be cured by therapeutic measures alone, ger life by pressure, and by interfering with those especially if the latter causes the least irritation, functions which are necessary to life, the question is I say this to show the high estimation I place on the one of quite another nature. A myoma may envalue of the proper observance of the laws of health. danger life by rapid development (rare), or by block-

CONSERVATISM IN GYNÆCOLOGY.

Read before the Gynacological Society of Boston, February,

BY HORATIO R. BIGELOW, M.D., OF WASHINGTON, D. C.

Gynacological Society on "The Conservation of a myoma, without alarming hamorrhage, that grows Energy and Conservative Gynecology," every point slowly, and that occasions no discomfort from pressof which I can now emphasize with double force; and ure, surely does not demand a dangerous operation; some time prior to this, I also made a plea for patience and yet I have seen many such cases die after a in the treatment of cophoritis and salpingitis. While laparotomy, when they probably would have lived my own personal experience in surgical gynecology many years had they been left alone. Any woman is exceedingly small, I have seen, perhaps, as many would much rather live on for years as a sufferer, than operations as most men of my years, and have assisted to have the tumor taken out at the risk of her life. at a large number. In the conservative treatment of | Even in the earliest stages of their development in the diseases of women I have had quite an intelligent which a diagnosis is possible, a Iaparotomy is always experience. What I write is based upon a long series a dangerous operation, and no surgeon can possibly of observations, and upon two years of hard work say beforehand whether such a tumor will assume an upon the Continent. I have, too, the courage of my alarming form or not. I am convinced that many convictions; for what I have seen, that do I believe myomata have been operated upon unnecessarily, and know. The surgeon, with his brilliant results, and I am equally sure that the careful use of ergot lays up for himself treasures upon earth, and brings and electricity by intelligent men will render the about him all the luxuries that wealth, reputation and necessity of laparotomy for uterine myoma an ex social prestige can give. The patient plodder in con-ception. The mania for surgical renown has become servatism is often out of pocket; goes to his home such an epidemic that medical men forget that there with many a misgiving and many a heartache. I hope are tumors and diseases which do better under confor his sake, at least, that there may be a real, actual servative handling. The mistakes that are made, and heaven, in which his treasures may be laid up, for the results that are obtained, should be lessons pregscientifically, if he has rescued his patient from suffer- nant of thought. But they are not. Death follows ing, he has done more than the surgeon who, in half death; mistake follows mistake; and still the crowd an hour, has rid her of pain at the expense of some rush madly on. of her organs, and at the risk of her life.

And first, I wish to say a word in regard to uterine than the advice urged by an eminent surgeon: tumors: I hold it as axiomatic that no tumor calls in doubt, open the abdomen and find out." It refor surgical interference unless it is immediately en-dangering life. This brings in the question of hæm-the trick." In the first place, there are few cases in orrhage and early operations. Hæmorrhage does en- which the competent gynecologist cannot map out danger life, it is true, but not in the sense which I the disease—approximately at least. In the second mean. I hold a hæmorrhage to be dangerous, only place, he has no right to relieve his ignorance at the when it fails to yield to conservative principles of slightest risk of a human life. Fortunately for us medicine—ergot, etc. Therefore, a myoma that bleeds presents no indications for removal, unless the epitance of such a doctrine. I have seen some bleeding be beyond the control of other well known splendid results following upon the use of ergot, and measures. Primary, simple hamorrhage, of itself have read of others equally good in Chicago. Aposdoes not endanger life, unless it be beyond the con-toli and others are doing first-rate work with electritrol of the medical man. Tumors only bleed when city. Certainly, with these facts patent, it is simply associated with endometritis fungosa, or with a predominant glandular endometritis, or with a glandular the abdomen, unless this practice has failed, and the endometritis on one side, conjoined with an intersti- woman's life is in immediate danger. tial endometritis of the other side. It may not be

ing up the pelvis and so interfering with the functions of the bladder and rectum, or by undergoing degeneration—but even in these cases, electricity and ergot should be given a fair trial. Every woman who has her abdomen opened subjects herself to a certain fatal risk. The responsibility of a fatal issue no surgeon has any conceivable right to assume, until he has satisfied himself that all other means are useless, and Over two years ago, I wrote a paper for the Boston that the woman must die unless operated upon. Now

> I cannot conceive of anything more pernicious uncalled for (I dislike using a stronger word) to open

These thoughts are impressed upon me by long

and close observation. I know of no cure for rapidly growing cysts, or for malignant growths, or soft myomata, but the operative treatment, and it is in these cases that an early operation is demanded—the earlier the better. Here surgery is truly conservative. Another class upon which surgery has gloated, is that in which the adnexa are involved. I have written so much, and at such length, upon this topic, and I have so often demanded a hearing for less "scalpel" and more patience, that I almost hesitate to add anything further. I will not go over the field which I have already traveled, because other men, abler than myself and of more experience, have lately urged the same plan of conservative handling. It is sufficient to say that many cases in which the operation is advised will get better by patient, persistent, vigorous treatment. Local applications, rest, treatment, exercise, electricity, Turkish baths, and a subjective condition of environment directed toward the patient's psychic symptoms, will surely, but slowly, bring about an amelioration. I have seen this plan work well, and to be in an aseptic condition, and were re-dressed in I know it to be true, even were I not supported by such men as Goodell, Ball and others. This line of treatment is troublesome and is best carried out in a through the dressings which necessitated their reprivate hospital; and unless the patient has some means, it is quite impossible to practice it properly. It has become almost a conviction with me, that the instances in which a laparotomy is necessary for disease of the adnexa are exceedingly rare.

My experience with these cases, and with this treatment, has been sufficiently ample to allow of my forming an opinion which is entitled to respect. Most earnestly, then, I urge upon the profession to rid themselves of their skepticism, and to try at least such regular, constant surveillance and care. field is wider than pure surgery, just as praiseworthy and brilliant, and more immortal in its results. Couple with surgery a thorough knowledge of conservatism, and the end must crown the labor.

Leipzig, November 6, 1886.

A CASE OF CARIES OF THE PATELLA FOLLOWING FRACTURE AND WIRING OF THE FRAGMENTS.

BY GEORGE R. FOWLER, M.D., SURGEON TO ST. MARY'S GENERAL HOSPITAL, BROOKLYN, N. Y.

The subject of the present report entered St. Mary's General Hospital on October 24, 1885, with the following history: About twenty years ago she fell and suffered a transverse fracture of the patella. The fracture was treated in the ordinary way, and in due course of time union by ligament resulted, with a distance of about two inches between the fragments. Three days prior to her admission to the hospital, she again fell and ruptured the ligamentous connecting band between the fragments, at the same time breaking up a partial anchylosis of the kneejoint of a fibrous character, which had existed ever since the first accident, twenty years ago.

At the time of her admission, there existed some synovitis and considerable effusion in the knee-joint, was made over the patella and the greater portion

the result of the recent injury. When this had subsided it was decided to open the knee-joint, remove the fibrous connecting band, and, after freshening the opposing bony surfaces, to bring the fragments together and secure them in position by means of the wire suture. This was done on October 26. antiseptic precautions were observed in the performance of this operation. The wire used was annealed iron, which was brought out of the transverse incision made for the purpose of exposing the fragments, and twisted over a bridge of hard rubber. Drains of soft rubber were employed, these being passed through the soft parts upon the lateral aspects of the joint only, and protrading but slightly into the joint cavity itself. Wood flour dressings were applied, and the limb placed in a fracture box made of

heavy wire cloth.

Everything went well for the first fortnight, when the dressings were removed for the purpose of re-moving the drainage tubes. The parts were found the same manner employed at first. At the end of forty-eight hours there appeared a discharge moval. An extensive cellulitis of the limb had occurred in the neighborhood of the knee-joint, and suppuration was already in progress. No union of the fragments had taken place, and on removing the bridge over which the wire had been twisted, the underlying soft tissues were found to be in a condition of ulceration, seemingly from the pressure of the The latter was removed, and the wire twisted closely to the bone through the opening produced by the ulcerative process. The parts were thoroughly irrigated by means of a one to one thousand solution of mercuric bichloride, and again redressed as at first. The cellulitis continued to extend, however, and the parts required re-dressing each day. During this time, however, the temperature was but slightly elevated, although the local distress was considerable. Incisions were made, and soft rubber drainage tubes introduced from time to time in places where pocketing of pus threatened, and thorough antiseptic irrigation practiced once or twice daily, in addition to the use of absorbent antiseptic dressings.

Under the above line of treatment the cellulitis gradually subsided, but no union of the fragments could be made out. On the contrary, as the swelling subsided, it became evident that the patella itself was diseased and the lax condition of the lateral ligaments of the knee-joint led to the belief at one time, that the head of the tibia had become separated from the shaft of the bone. The wire was removed at the end of the sixth week, at which time the drainage tubes were likewise dispensed with, the openings from which the latter emerged becoming reduced to mere sinuses. The point of ulceration over the patella obstinately refused to heal, and the probe detected indubitable evidences of carious bone at the bottom of the opening caused by the ulceration over the patella. On February 15, three months and a half following the receipt of the injury, an incision

curetted by means of Volkmann's sharp spoon.

the same antiseptic dressings heretofore employed, ing the joint. and the patient left the hospital on May 31. She first fracture of the bone.

Several points present themselves for notice in re- exposure. flecting upon the history of this case. In the first place, it may be asked with propriety if it were a justifiable procedure, this opening of the knee-joint, and dissecting away the old connecting band of fibrous tissue and wiring together the fragments. My reasons for doing so were, in the first place, the fact that there had existed great disability for twenty this was in a great measure due to the long ligation Vienna, gave the following diagnostic points of mentous union existing between the fragments. The | brain disease: patient belonged to a class in whom it was very desirable that as near an approximation to the normal should obtain, on account of the necessity of earning solely upon herself for support. It was thought that sion on the dura caused by the bulk of the tumor. her condition could be made no worse by an attempt to obtain bony union of the fragments, and in the meninges, and more frequently in leptotheir could be no question as to the desirability of meningitis than in pachymeningitis; in lepto-menobtaining the latter. In the second place, it was my intention to search for, and remove if found, any adventitious bands within the joint which might be held accountable for the anchylosis previously existing. I omitted to mention that no such bands were discovered at the time of the operation for wiring the fragments.

It has been my practice to use heavy silver wire for the suture, instead of iron, but in this instance such was not at hand, and the iron was substituted. Whether the oxidizing of the iron could have acted as an irritant is an open question, which I am not prepared to discuss at this time.

The use of the bridge of hard rubber upon which the wire was twisted is a device to which I have resorted upon previous occasions, and have not heretofore thought that it produced trouble by making undue pressure upon the soft parts. I am free to confess, however, in this instance at least, that the ulceration beneath its under surface was a direct result of the pressure of the bridge.

The wisdom of the course pursued in the matter of the treatment of the capsule of the joint, namely, case. This structure was carefully sutured with a medulla; or tumors of the medulla or pons. fine continuous suture of catgut, independently of

of the latter gouged away, it being found to be ex- the suture which closed the external portion of the tensively diseased. In this operation the knee-joint operation wound. To this, no doubt, is due the imwas unavoidably opened, but it was thoroughly irri-munity from destructive inflammation enjoyed by gated with the bichloride solution. The sinuses, as the knee-joint, in the midst of the conflagration, so well as the surface of the ulcer over the patella were to speak, which swept over that portion of the limb during the first few weeks following the operation. Nothing further untoward occurred in the history Immediate and perfect union of the wound in the of this case. The sinuses, as well as the ulcerated capsule took place, thus shutting it out from the irsurface overlying the patella healed readily under ritating fluids which infiltrated the tissues surround-

Although great care was exercised in the removal was able at that time to walk unaided. There was of the carious portion of the patella, yet in spite of some fibrous anchylosis of the knee-joint, yet mo-this the cavity of the knee-joint was invaded. The tion was possible, to a limited extent. Upon this condyles of the femur, as well as a portion of the latter point the patient was perfectly sure that no head of the tibia, were brought into view. Notwithgreater amount of disability was present than had standing this, the antiseptic measures were so far existed prior to the last injury, and following the efficient as to entirely protect this important articulation from infection, and no harm came from this

MEDICAL PROGRESS.

Diagnosis of Brain Diseases.—Nothnagel, in years following the fracture in the first instance, and a recent article read before the College of Physicians

- 1. In brain tumors headache is of very little value in diagnosis; the cerebral substance is not sensitive; condition of the members of the body as possible the pia mater but little sensitive and the dura mater only, of the cranial contents, is sensitive. Headtheir living. The patient was a widow, and relied ache in cases of cerebral tumor is explained by ten-
 - 2. Headache is present in inflammatory processes ingitis the headache frequently changes its character.
 - 3. Headache is present in chronic cerebral hyperæmia and chronic anæmia; it is questionable whether anæmia alone is the important element in chlorosis, as most marked cases of pernicious and intensive anæmia are caused by carcinoma in which headache is absent. Headache is rare in insular multiple sclerosis; in cerebral abscess its presence and character are variable. The location of the headache gives no certain diagnostic point as to the location of the lesion, though in general it may be said that usually the lesion is where the headache is.

Vertigo, though common in various cerebral diseases, is of little importance; when it is excessive and accompanied by incoördination, as in diseases of the crura cerebelli, it has decided import.

Vomiting is rarely of much value in diagnosis; it aids chiefly in the location of lesions. It may be present in cases in which the amount of blood in the brain is abnormal, and an irritation of the centre of emesis in the medulla oblongata exists. We are aided by this symptom in diagnosticating lesions of the tissue in the posterior fossa of the skull; e.g., a separate suture of the same, is illustrated in this tumors originating in the cerebellum press upon the

Fever is an important symptom in but few cerebral

diseases. The highest temperature is present in of the drug. By all observers the dose most fremeningitis, especially in its infectious form. But as quently used is 25 gms. (gr. iv). When this dose did peritonitis without fever is often seen, so meningitis not give satisfactory results Cahn and Hepp remay run its course without marked rise of tempera- peated it at intervals of one-half to one hour; .5 gms. ture. Fever occurs in cerebral abscess and septic phlebitis of the cerebral sinuses; it has then more often the characteristics of septic fever with pyæmic chills, and does not depend directly upon the phlebitis, but upon pulmonary embolism. Fever also occurs in the course of progressive paralysis. The pulse gives no certain criterion for the diagnosis of a given cerebral disease. It is often, however, of value in the abnormalities of its rhythm in beginning meningitis, in the form of regularly occuring arythmia (first described by Nothnagel), where a certain periodicity in the variations of the pulse frequence occurs; the increased number of beats endures but a few moments, and is caused by an irritation of the pneumo-gastric nerve. The respiration gives no information in the diagnosis of brain diseases.

As to disorders of speech, aphonia is seldom present and the location of the lesion which could hamorrhage from wounds, unless due to lesion of cause it, in the medulla oblongata, is such that death large vessels or in excess, does not interfere with generally results speedily in these cases. Speech is affected most often in progressive bulbar paralysis, and frequently in multiple sclerosis in patches. Speech is also implicated in progressive paralysis when the origin of the hypoglossus is affected; also in cortical disease of the lower portion of the central gyrus.— Wiener medizinische Presse, No. 13.

Antifebrin.—Eisenhart (München. Med. Woch., drug in thirty cases in the medical clinic of Ziemssen. appearances of collapse, in more than half of the produced no lowering of the temperature. The apyrexia produced by it lasted generally six hours. It acted as readily when administered by enema as by the mouth. In a single case of typhoid fever it produced over the entire body a papulose eruption sorption.—Gazetta degli Ospitali, April 13, 1887. of moderate size, which disappeared after two or three days' duration under the continued use of undesirable effects they have observed, at times, a the temperature rises, and sometimes after its effects eruption and sometimes a cyanotic appearance. quency and an increased tension of the vessels. urines having from 2 to 3 per cent. of sugar.— Lancet, Moreover they call attention to the quieting effect April 23, 1887.

(grs. viii) doses they gave in the same way, and administered the drug in single doses of 75 to 1 gm. (gr. xii to gr. xv). Small repeated doses appeared in rather severe cases useless, while single large doses produced prompt effects. They never used per day more than 2 gms. (grs. xxx), but think that much more might be given with safety. The drug was administered in watery solution, in urine or wafers. In regard to the undesirable coincident effects of antipyrin Heinzelmann (Münchener med. Wochenschr. 1887, No. 3) adds that he has observed after sweating, once partial deafness, once mydriasis, but never vomiting or eruptions upon the skin.—Centralblatt für klin. Med. 1887, No. 17.

The Value of Hæmorrhage in Treating Wounds.—Taruzza publishes a note to show that primary union. He does not think it necessary to follow strictly the rule to secure complete arrest of hæmorrhage and to apply firm compression. He relies on perfect disinfection of the bleeding surface, as far as possible, by means of weak solutions of carbolic acid or mercuric chloride. After this he leaves the cavity of the wound full of blood, the edges being accurately sutured, and without fear that primary union will not result. From his experi-No. 47, 1886), tested the therapeutic action of this ence he formulates the rule: "In wounds perfectly disinfected and free from foreign substances effusion The activity of the drug usually manifested itself of blood is not a source of danger, but the reverse, two hours after its administration, sometimes with as the effused blood fills the wound-cavity perfectly, preventing the formation of empty spaces, and makcases with copious perspiration, and in a few cases ing compression and drainage superfluous; and the organization of the clot favors union." He is opposed to the drainage tube, thinking that it increases risks of sepsis, and may remove from the wound fluids which, when aseptic, may be useful by reab-

ALBUMINURIA IN DIABETES.—Dr. A. POLLATantipyrin, only to break out anew. Cahn and Hepp schek, of Carlsbad, has published (Zeitschr. f. Klin. (Berlin. klin. Wochensch., 1887, No. 1 and 2), have Med., xii., 4) some statistical results of the systematic published the results of a new series of tests of examination of diabetic urine for albumen, with a antipyrin in sixty cases of various kinds of fever, view to determine whether the occurrence of the They reaffirm that it is a strong and sure antipyretic, latter varies in proportion with the amount of sugar. one that can be used in small doses and is relatively. He found that out of 1187 specimens containing free from coincident undesirable effects. Of these sugar, in amounts varying from traces to as much as 5 per cent., there occurred more or less albumin in fall of temperature below normal, a chill as again 437. The percentage (37) was almost the same, when reckoned on the cases examined in 1885, as on pass off a rise of temperature above that previously those of 1886, showing a curious uniformity. By observed in the case, also occasionally, a red miliary grouping the specimens of urine according to their richness in sugar, he shows that there is no constant They noticed a decided increase in the quantity of relation between the amount of albumen and of urine and fall in its specific gravity, together with in-sugar—the lowest number of albuminurics (29.1 per creased thirst in severe cases. Parallel with the fall cent.) occurring in cases of urine with a minimal in temperature occurred a lessening of the pulse fre-quantity of sugar, and the highest (43.8 per cent.) in

The results obtained entitled, "Respiratory Therapeutics in the Treat- with this apparatus certainly warrant a more general ment of Phthisis Pulmonalis," but he limited his use of the method. But, though the patients were remarks to one division of the subject: the local relieved of their symptoms, and the evidence in treatment of phthisis by medicinal agents applied to many cases pointed to a cure of the process, the the interior of the respiratory tract in finely divided scanty expectoration still contained bacilli, except in particles. While he may be thought too sanguine, one case, in which the vesicular murmur returned, Dr. McNamara thinks that from his experience with and both the râles and bacilli disappeared. this plan we now have a proper and scientific method of treating phthisis, especially in hospitals.

logical sequence of putting the theory into practice. ulcers of the mouth, gum, tongue or legs; and the

But Dr. McNamara does not consider the antiseptic treatment of phthisis the only form of treatment worthy of application to the diseased lung. He believes that it is at present a necessary and most important means of modifying the course of the disease; but the physical conditions caused by the extension of the inflammatory irritant naturally call for other methods of treatment.

While the greater number of appliances for producing sprays are of no use, it must be admitted that we can obtain a spray sufficiently fine to pass the larynx and penetrate beyond the larger bronchi. For almost two years Dr. McNamara has used an apparatus which has given him great satisfaction, a description of which is to be found in our New York letter. The spray produced by this apparatus consists of a central stream of very great attenuation, the larger particles of the atomized fluid being projected against the sloping sides of the globe, and being condensed fall as drops into the original solution, so that they As the active treatment of phthisis is now attract, do not escape through the mouth piece. Again, King. Such external pressure would cause the part in cases of chronic phthisis attacks of capillary bron-, of the feetus in contact with the foramen to move in chitis and broncho-pneumonia sometimes occur, mak- a posterior direction towards the hollow of the sacrum. ing them appear like acute tuberculosis; and under "If it is found to be of any value, the pressure should these circumstances the violent symptoms usually be made in the left occipito-anterior position of a subside in a short time. There are, then, many cases 'head' presentation, and in the left mento-anterior in which one might be led to suppose that the tuber-position of a face presentation only upon the right culous process is much more advanced in the lungs sacro-sciatic foramen, so as to cause the occiput in than is really the case; and it is possible that some the one case, and the chin in the other, to come of the cases reported as being so much benefited by towards the pubis; while in the right occipitothe Bergeon treatment are of this character.

While it may be objected that such measures do not destroy the bacilli, or cause them to disappear, the counter-objection may be raised that, so long as the other symptoms improve and disappear, we need not concern ourselves too much with the bacilli; and ject it was easy to feel the end of the blade on the at present it may be fairly questioned whether the bacilli will not finally disappear from a case which is kept at a high standard of improvement. And certainly, with our present knowledge of germicides, it would not be wise to make vigorous efforts to destroy the bacilli at the risk of injuring the patient by irritants. And while it may still be true that our main reliance in the treatment of phthisis is in constitutional remedies, including the selection of a suitable climate, other measures are not to be neglected; and in a large number of cases change of climate is, for pecuniary reasons, out of the question.

THE INFLUENCE ON LABOR OF PRESSURE OVER THE SACRO-SCIATIC FORAMEN.

Can we influence the mechanism of labor by external pressure over the sacro-sciatic foramen? is the question asked by DR. A. F. A. KING in a communication in the American Journal of Obstetrics, of May. While examining some cadavers he found that such pressure produced an elevation or protrusion at the same point in the interior of the pelvis. Having removed the uterus and appendages, he anointed the pelvic cavity with vaseline, and placed in the pelvis a good-sized, recent feetal head, also anointed with the vaseline. The head was placed low down facts lead us to hope for will be awaited with interin the pelvic cavity, with the occiput towards an acetabulum, and the forehead towards the opposite sacro-sciatic synchondrosis. Pressure with the fingerends over the sacro-sciatic foramen towards which the forehead was directed easily caused the head to rotate, bringing the forehead to the sacrum and the occiput to the pubis.

Could the same thing be done on the living subdiseased part is as inaccessible as the lung. But in-subject? When rotation fails to take place during anterior and right mento-anterior positions of the same presentations, respectively, the pressure must be made upon the left sacro-sciatic foramen; and so of the other positions and presentations." When the vectis or forceps was applied on the dead suboutside, through the tissues covering the foramen; and pressure upon the instrument at this point would distinctly move the handle and cause rotation. It was also found that when the lower extremities of the cadavers were bent back as far as possible, thus bringing them into the same relation with the trunk as would occur in kneeling, the heels just reached the sacro-sciatic foramina; and when they were firmly pressed against the tissues over the foramina the same elevation was made on the interior of the pelvic cavity, and the same movement of the head was produced as by digital pressure. It is then fair to ask—Would a kneeling posture during labor, with the heels at the points indicated, expedite labor by promoting rotation?

> While it may be said that the tonicity of the muscular and other structures covering the foramina differ in the living and dead subjects. states that pressure over the foramen in the living will also produce an impulse perceptible by the hand placed over the abdomen, and even by the eye, if the abdominal muscles be sufficiently relaxed. He also states that a moderate degree of rotundity does not make any great difference in the result as compared with the experiment on emaciated subjects.

> Verification in actual cases of labor of what these est. It is certainly possible that the conversion of the soft internal depression of the sacro-sciatic space into a solid elevation, and maintaining this during a few labor pains, may have a great deal of influence in promoting the normal movement of the presenting part.

MEDICAL LEGISLATION.

posing several amendments to the law for regulating the practice of medicine that has been in force since 1877, has been defeated. Precisely what the nature and scope of the proposed amendments were, we do not know, not having seen a copy of the bill.

There is another bill before the Legislature, having for its leading object such amendment of the existing law in this State, as to secure a more humane and rational mode of proceeding for the commitment of the insane to asylums, or otherwise depriving them of their personal liberty. It is well known that the State of Illinois enjoys the unenviable honor of having a law which requires every person supposed to be insane, to be arrested and brought before a court and jury, for the purpose of determining their sanity or insanity, before they can be received in any asylum or institution for the cure of the insane, in this State.

The law makes no exceptions, and the mother who becomes insane during her confinement after childbirth, and all other cases of acute general insanity, are compelled to go through the same inhuman process of exposure in open court and the mockery of a trial before a jury of six or twelve men, only one of whom is required to have any semblance of medical knowledge. The medical profession of the State have not ceased to protest, on all proper occasions, against the law, since it was enacted several years ago, under the delusion that it would lessen the danger of having parties fraudulently deprived of their liberty by the collusion of friends. This earnest and persistent opposition to the law as it exists, arises from no personal interest that the physician has in the matter, but from the instinctive horror he feels seeing men and women phrenzied with maniacal delusions arrested, sometimes locked in cells two or three days waiting for trial, and then brought into a court-room, subject to the gaze of a crowd of spectators; all the time conscious, as he is, that the proceeding not only does not add one particle to the safety of the patient, but often adds to the danger of making the insanity permanent or early fatal in its results. Three years since the Illinois State Medical Society, through an able committee, framed a Bill proposing to so amend the law that cases of acute general mania could be committed to proper asylums the material presented by skillful but unscrupulous by the Judge of a court of competent jurisdiction on the sworn testimony of two physicians, as is done in all other civilized countries, while the trial by jury in open court was still left for all such parties as might laborer may bring to the common stock of ascer-

ask for the same, or any one of whose friends might The bill before the Himois State Legislature pro- ask it for them. The Bill was presented to the Legislature then in session, but was not acted upon. We understand that a bill is now before the two branches of the Legislature with the same amendments regarding the proceedings on commitment of the insane, with some additional sections relating to other points that we have not seen. At the recent meeting of the State Medical Society, May 19, in this city, the following resolution, offered by Dr. N. Bridge, was passed unanimously:

> Resolved, That this Society heartily indorses the provisions of the bill now before our Legislature providing for the commitment of the insane in certain cases without trial by jury, and asks the Legislature to enact these provisions at least.

> It is to be hoped that the members of the present Legislature will not allow a final adjournment without complying with the reasonable and humane request contained in this resolution.

> PROFESSORS M. SEMMOLA and DURANTE, of Italy, have been designated as representatives in the International Medical Congress to be held in Washington, in September next.

SOCIETY PROCEEDINGS.

AMERICAN SURGICAL ASSOCIATION.

Eighth Annual Session held in the Army Medical Museum, Washington, D. C., May 11, 12, 13 and 14, 1887.

WEDNESDAY, FIRST DAY.

MORNING SESSION.

The Association was called to order by the Presi-DENT, DR. HUNTER McGutre, of Richmond, Va., who delivered the President's Address on

THE NEED AND VALUE OF COOPERATIVE WORKS IN SURGERY.

Nearly every advance in whatever is accomplished by human enterprise is secured by cooperative effort. Advance in surgery can be more surely made by Associations such as ours than by any individual efforts of man. The difficulties which beset us are numerous. Disease presents problems difficult of solution. We cannot apply to the human machine the fixed rules by which inanimate bodies are governed. Besides this, it is necessary to get rid of the rubbish with which we are too often flooded by ignorant, but ambitious contributors. This is an easy task, but it is more difficult to know when to reject workers, who to gratify their own personal vanity, make false returns of their labors. For the developments yet awaiting us, we must be indebted to the contributions which every patient and conscientious

tained knowledge, and we shall accomplish this best. After the patient has been etherized, the surgeon by the cultivation of a broad and generous apprecial should introduce a rubber bag into the rectum so as tion of each others work, from which every particle to be above the internal sphincter. Into this twelve who have enlarged the boundaries of surgical science, or who have improved its art.

In concluding his address the President made the

following suggestions:

1. The formation of a business committee to prepare the work of the Association. The committee should select two general subjects in surgery to be discussed at the morning sessions of the first and second days.

2. The address of the President should be limited to half an hour; readers of papers to the same length of time, and those who take part in the dis-

cussions to fifteen minutes.

- that we should have is scientific work.
- 4. That the report of the committee with reference to the American Congress of Physicians and Surgeons be adopted.
- 5. That the Conststitution be so amended that propositions for membership shall lie over for one year. The qualifications for fellowship should be age, experience in surgical work, and scientific attainments with general culture.

A committee of five was appointed to take into closed and a tube introduced. consideration the suggestions offered by the President. The committee consists of Drs. S. A. Gross, C. H. Mastin, D. W. Yandell, Moses Gunn and C.

The Association then went into Executive Session.

AFTERNOON SESSION.

Dr. F. S. Dennis, or New York, read a paper on

EXPLORATION OF THE BLADDER, BY THE SUPRA-PUTAC METHOD.

W. E., age 70, was admitted April 24, 1887, with retention due to enlarged prostate. Supra-pubic cystotomy was performed and a large quantity of putrescent urine removed. A rubber tube was passed into the bladder. The urine contained albumen to the amount of one-half its bulk. Granular casts were also found. A typhoid condition developed and the patient died on the fourteenth day after admission.

R. M., age 40, was admitted the same day. He had double inguinal hernia and double hydrocele. He had passed no urine for fourteen hours. Catheterization was attempted without success. Supra pubic incision was then performed and a rubber tube introduced. He has done well since then and is beginning to pass some water by the urethra.

SUPRA-PUBIC CYSTOTOMY FOR OTHER PURPOSES THAN | cautions should be observed in these cases. In most of the cases on which the author had operated the In 1883 he removed, by supra pubic cystotomy, a question whether or not the bladder should be distended had not presented itself, as the bladder was already over-distended. The bladder should never be more than moderately distended, not more than retention of urine from stricture, where a fair attempt six or eight ounces of a boric acid solution being employed. To retain the water in the bladder a conaspiration. In a short time an instrument can usually venient method is to bend the urethra on itself and be passed. He did not recall a case in which it was hold it in this position. There seems to be more necessary to repeat aspiration. One was probably complitude the autonomy of each special Society, and that each Society cated with some form of tumor of the bladder and a shall retain the right to withdraw at any time from this conhistory of chronic disease of the kidneys. One was joint scheme.

a case of chronic alcoholism one was complicated.

3. That the special feature of the meeting shall be the cona case of chronic alcoholism, one was complicated with sacculated bladder, and the last two were cases the session; on one of which there shall be an address delivered of surgical kidney of the very gravest kind. Of the by the President of the conjoint meeting, and on the other there litholapaxies in the male there were eighteen patients having twenty-two operations, four requiring a secone after the second operation.

With reference to supra-public lithotomy, the author said that with the excellent results we are ever likely to obtain from rapid lithotrity, the operation must necessarily deal with severe cases of large, and in some instances sacculated, stone. He did not believe that we should ever expect from it as great a per cent. of recoveries. A table of reported cases of supra-pubic operations was given, showing that in 142 adult cases, a mortality of 22 per cent.; in chil-

ity of 10.5 per cent.

trary to the teachings of a few years since, can be resentative of the Association. done in very young male children with proper instruments. In male adults, if there is severe chronic then taken up. cystitis, no matter what is the size of the stone, the supra-pubic or some other form of perineal lithotomy the speakers in his paper held that the time would seems best. The cystitis can then be successfully come when supra-pubic lithotomy and litholopaxy treated and there is less danger of a reformation, would practically be the only operations performed The speaker thought that it would be found by fur for the removal of stone. The surgeon should have ture statistics that cystitis has much to do with the all operations at his command and should select the necessity for a second or third operation. He thought one adapted to the particular case. In certain cases, that contracted bladder in the male with adhesions such as large stones or deformities of pelvis and had not received the attention which it demanded. lower extremities, supra-pubic lithotomy is undoubt-This must in some instances embarrass supra-pubic edly the best operation. There is, however, no realithotomy. On anatomical grounds the supra-pubic operation will be much simpler in the youth, as the perineal operation should not be adopted. The best bladder is much higher in the pelvis at this time of life. In girls rapid dilatation or supra-pubic lithotomy will undoubtedly reach all cases. In adult women vaginal lithotomy may be added.

The discussion of these papers was postponed un-

til Thursday morning.

THURSDAY, MAY 12.—SECOND DAY.

Morning Session.

The discussion of papers read on Wednesday was

Dr. W. T. Briggs, of Nashville, said that one of son why, in ordinary cases of medium stones, the operation, he thought, was one through the median line. The neck of the bladder is usually resistant, but by making a lateral incision of three lines on each side of the prostate gland, with gradual dilation, the opening can be enlarged to an extent sufficient to permit the removal of any stone that should be removed through the perineum. There is no reason why fragmentization of a large stone should not be combined with the medio-lateral operation. held that incision in the manner mentioned with the removal of all stones at once, would have a less mortality than litholapaxy. His first seventy-four cases were operated on by this method without a death. He then had two deaths, in one a pelvic abtheir meeting the following resolutions were adopted: was scrofulosis. Forty-six cases were then operated Resolved, 1st, That it is desirable that the following special on with one death. This case died three months

ununited. In the last two years he had operated on in this direction the supra-public operation is the six old men with an average age of 66 years, all safer. With reference to Dr. Packard's suggestion

we cannot commit ourselves positively to any one sistent efforts should be made to introduce a filiform operation. The median operation is undoubtedly bougie which will drain off the urine. Simple aspirathe safest operation through the perineum. The tion above the pubes will give a chance for the only damage likely to be done is in extraction, but passage of an instrument through the urethra in two this can be avoided by nicking the neck of the blad- or three days. der which admits distension to almost any extent. Where the stone is large, and yet is one which should; come through perineum, an incision may be made ease, that supra-pubic aspiration seemed to be all on each side. Drainage is more readily effected by that was necessary, and under proper precautions is the perineal operation. In cases of large stone the high operation is the best.

DR. J. R. WEIST, of Richmond, Ind., said that he had performed the operation described by Dr. Briggs in eight cases, all of which recovered. With one exception all the patients have been old. One case was 20 years of age, and a mulberry calculus weighing 520 grains was removed. The next youngest age was 50 years old, eight stones being removed. In another case 72 years old, twenty-two stones were removed. From the accounts of the supra-pubic operation given vesterday, he inferred that the operation is more difficult of performance than the one described by Dr. Briggs.

DR. H. H. MUDD, of St. Louis, said that the use of litholopaxy in the majority of cases takes the place of perineal operation. The supra pubic operation is of service for the removal of certain large stones and for exploratory purposes. It must be borne in mind that the existence of contracted bladder with adhesions will render the supra pubic operation difficult or impossible.

Dr. J. Collins Warren, of Boston, had seen two cases of the supra-pubic operation during the past year, both in the practice of others. One was for stone and the other for tumor. There seemed to. be no difficulty in the operation. Both cases recovered without a bad symptom.

Dr. Theodore Varrick, of Jersey City, operated two years ago on a boy 14 years of age, who had symptoms of stone for seven years. He began with the left lateral operation, but had to carry the in- SHOULD LAPAROTOMY BE DONE FOR PENETRATING cision to the right side. The stone removed weighed seven ounces and two scruples. There was no perceptible laceration and the boy recovered completely.

he had performed ninety-two operations by the perineum, eight by lithotrity, and six by litholopaxy. the operation no easier or better than those men-There were seven deaths from the lithotomies. In none of the cases was there any return of the stone. In the eight lithotrities there was a return of the stone in two cases. In the six Bigelow operations there was a return in two cases.

Dr. John B. Roberts, of Philadelphia, considered the high operation as certain to be a very important one. If we wish to make a free exploration of the bladder the high operation is better than

to treat retention of urine from stricture by supra-Dr. D. Hayes Agnew, of Philadelphia, said that pubic cystotomy, he said that his view was that per-

> Dr. J. E. MICHAEL, of Baltimore, said with reference to retention due to stricture or prostatic dissafe. Then, in prostatic cases the use of a soft catheter will accomplish all that can be done, without some radical operation is attempted. In cases of stricture this must be treated. As to the advisability of the supra-pubic operation for exploration, for some cases of prostatic enlargement, and for exceptional cases of foreign bodies, there can be no question.

Dr. J. Collins Warren, of Boston, read a

STUDY OF THE PROCESS OF REPAIR AFTER RESEC-TION OF THE INTESTINES AND SOME OF THE COMPLICATIONS WHICH OCCUR.

A number of experiments made upon dogs were described. The operation consisted in removing a portion of the intestine and a V-shaped portion of mesentery, and then bringing the parts together. The Lembert suture was the one used. After the operation the bowel was replaced in as near its normal position as was possible. The dogs were killed at varying times after operation from three to eight days. In these cases the intestines were found matted together around the seat of operation, but a current of water flowed freely through the gut. In one case the abdomen was opened a few days after operation and this matting together of the various coils of intestine found. The intestine was replaced and the wound again closed. Six months later most of the adhesions were found to have disappeared.

Dr. Charles B. Nancrede, of Philadelphia, read a paper entitled

GUNSHOT WOUNDS OF THE ABDOMEN INVOLV-ING THE VISCERA?

The chief object in presenting this subject to the Dr. David W. Yandell, of Louisville, said that consideration of the Association was a medico-legal one. He asked that after a consideration of the subject the Association, the highest surgical tribunal He had seen two supra pubic operations, but thought of the country, express an authoritative opinion upon this question. Reference was made to the experiments of Wegner and Grawitz, showing that the healthy peritoneum can dispose of air, serum, bile, and healthy urine. When, however, air and putrescible fluids in greater amount than could be disposed of in a short time were introduced, decomposition occurred, and septicæmia resulted. A notable exception was that living defibrinated blood never decomposed under these circumstances. This seems to prove the truth of the suggestion of the author the one through the perineum. In cases of stone that the presence of fibrin-ferment, and probably its operated on by a surgeon without special experience absorption, is one of the dangers of peritoneal trau-

a short time. In small quantities the pathogenic impossible, without laparotomy. micro-organisms produce no harm. Suppurative when stagnant fluids are present, capable of nourishhas been destroyed by caustic fluids, and when there is a wound of the peritoneum. The practical application of these experiments teaches that all blood and serum should be removed and free drainage provided; every wounded surface must be coaptated; if a tube is used, the opening must be carefully guarded; the depression of the circulation present during shock must be removed; and the vascularity of the peritoneum must be kept as near the normal as possible.

When visceral wounds do undoubtedly exist, the tendency of these cases is invariably towards death. Hæmorrhage, in itself, is rarely fatal, but a very small collection of blood may be followed by fatal consequences, either through the induction of sapræmia or by furnishing pabulum for the development of organisms productive of suppurative peritonitis. nitis caused by extravasated matters. Of those attacked with septic peritonitis 90 per cent. die within twenty-four hours. When recovery ensues, the effused matter is absorbed and a limited adhesive peritonitis glues the injured organ to the abdominal walls or to a neighboring viscus. This process is successful in about 8 per cent. of the cases. Shock, and the risk of rendering a peritonitis septic and diffused, which might have remained local and simple, are the dangers of the operation; but as we have the power of rendering the inflammation resulting from the manipulations innocuous, shock is practically the only result to be dreaded. If these facts and the deductions from them be true, all ball wounds of the abdomen involving the stomach, intestines, bile, or urinary bladder should be treated by suture, or by resection and suture. Injured omentum should always be excised and the serous surfaces carefully sutured. Wounds of the liver and pancreas are to be treated in the manner to be described. A wounded spleen or kidney is to be removed, provided certain contra-indications do not exist. Even penetrating wounds of the abdomen without involvement of the viscera are better treated by exploratory section than by the expectant method. In many instances, unsuspected injuries of the blood-vessels and viscera will be found and appropriately treated. The speaker domen. When the posterior wall is involved, it is ation, the bleeding is almost completely checked, the

matism. The ordinary micro organisms produce no unadvisable to ascertain the fact of peritoneal peneevil effects, provided the quantity of putrescible mat- tration by direct exploration. In these cases, a corter does not exceed that which may be disposed of in rect opinion is almost always difficult, and often

The rational signs of peritoneal or visceral lesion peritonitis is produced by these micro-organisms were briefly mentioned. The escape of bile, fæces, or the contents of the stomach, at once determines ing the bacteria, when the surface of the peritoneum the question of visceral penetration. These signs, however, are rare, even when visceral lesion is present. Repeated vomiting of considerable quantities of blood almost certainly points to peritoneal or vssceral penetration. This symptom is unlikely to be present, even when there are numerous wounds, unless one involves the stomach or upper portion of the small intestine. The passage of blood in quantity by the bowel is strong presumptive evidence, but it rarely occurs early enough to be of practical diagnostic value for operative purposes. The presence of fluid within the abdomen within an hour or two after the injury is a positive indication of peritoneal penetration and probable visceral injury, for only intra-peritoneal hæmorrhage could produce such rapid accumulation of fluid. The rapid accumulation of intestinal gas in the general peritoneal cavity is a sure sign of wound of the peritonenm and of the gut. In nearly every case, death is due to septic perito- To be of much value it must appear within a short time after the injury. Finally, an amount of hæmorrhage which cannot be accounted for after a careful examination of the parietal wounds, indicates penetration and vascular or visceral lesion.

Profound shock, if not due to hæmorrhage, is a contra-indication to operation. The surroundings should not contraindicate operation in a proper case, provided the operator is an expert in abdominal surgery. Most cases will do better if left to nature than they will if operated on by a bungling surgeon. If well advanced peritonitis exists, laparotomy is contra-indicated. Where there is no visceral complication, operation under these circumstances may sometimes be justifiable. Laparotomy, if done at all, should be done at the earliest possible moment that the condition will admit of it. Shock is the only thing that should delay the operation, and this should not do so if the condition is produced by hæmorrhage. In operating, strict antiseptic precautions should be carried out. The incision should always be median, extending from a short distance above the umbilicus to two inches above the pubes. Unless there be free hæmorrhage, the small intestines should be carefully gone over, keeping them constantly enveloped in towels wrung out of hot water. Afterwards the stomach, spleen, kidneys, bladder, etc., must be carefully examined. The sources of a severe laid but little stress upon most of the symptoms said harmorrhage must at once be sought for. Wounds of to be diagnostic of wounds of the viscera, and held the bowel should be secured with the Lembert suture that the diagnosis should be made by the eye alone. and dusted with a little iodoform. Since Dr. Coleman had menof the bowel should be excised. Wounded or con-tioned the substituting a plus cylinder for a minus tused omentum or mesentery should also be removed. In removing a portion of the bowel, the cuts should correspond to the distribution of a large mesenteric branch. Should the pulse fall during the operation, flushing the abdominal cavity with hot water is often factory. of service. The peritoneal toilet is most quickly and effectively made by irrigation with warm sterilized more satisfactory than the plus. He has frequently water and subsequent removal with sponges. Wounds of the peritoneum should be united. In closing the abdominal cavity, the peritoneum should be sutured. with fine silk or catgut. The muscular, aponeurotic, and cutaneous structures should then be united with strong silk. The wound should be dusted with iodoform, and the dressing completed by the application of a pad of absorbent cotton and a flannel bandage.

for forty-eight hours, when possible. Where peritonitis comes on after the operation, the treatment will depend upon whether it has developed rapidly or gradually. In the former case there is often evidence of shock from vaso-motor paresis; and in these cases small doses of morphia with atropia will be of service, while large doses of opium may prove fatal. This should be continued until pain is relieved and the patient falls into a quiet sleep, from which he is readily aroused. In the latter stages of peritonitis, one or more hypodermics of atropia will at times save otherwise hopeless cases. For the control of the vascular processes involved in peritonitis we have two powerful measures in the ice coil to the abdomen and in the use of leeches, if applied early and the patient has not lost much blood. If the temperature continues to rise despite treatment, it is probable that promaines are being absorbed, producing sapræmia. In such cases, irrigation with safe antiseptic fluids is indicated.

In concluding, the speaker stated that everything advanced was to be viewed as more or less provisional, since sufficient experience in the operative treatment of these cases has not been accumulated. to warrant positive statements.

(To be concluded.)

CHICAGO SOCIETY OF OPHTHALMOLOGY AND OTOLOGY.

Stated Meeting, February 8, 1887. THE PRESIDENT, E. L. HOLMES, M.D., IN THE CHAIR.

BOERNE BETTMAN, M.D., SECRETARY. Dr. W. Franklin Coleman read a paper on THE USE OF A PLUS CYLINDER IN SIMPLE MYOPIC AS-TIGMATISM OF LOW DEGREE.

(See p. 592.)

Dr. Gardiner said he preferred to give the same tampon removed. If, however, the bleeding is still minus cylinder glass for reading as for distance. Dr. Gradle has always found the minus glass noticed that the axis of the minus cylinder determined with homatropine differs from that determined when the accommodation recovered, but the patient always accepted the former in reading.

Dr. GARDINER said he had frequently noticed the patient in reading change the axis of the distance

Dr. Coleman, in reply, said that in his experience, Alimentation should be carried on by the rectum patients with low degrees of myopic astigmatism did not care to wear glasses for distance. He was pleased to hear the experience of these members, though it differed from his own.1

DR. J. ELLIOTT COLBURN read a paper on

GALVANIC CURRENT IN THE TREATMENT OF CERTAIN FORMS OF CATARACT.

(which will appear in an early issue.)

Stated Meeting, February 12, 1887. THE PRESIDENT IN THE CHAIR.

Dr. F. C. Hotz reported a case of

PARTIAL TRICHIASIS RELIEVED BY STELLWAG'S METHOD OF REVERSING AND TRANSPLANTING THE CILIARY BORDER.

(which will appear in an early issue.) THE PRESIDENT presented a

CATARACT GLASS, DOUBLE CONVEX CYLINDRICAL,

axes at right angle and equivalent to ± 12, D. spherical, ground by Meyrowitz Brothers, New York. He stated that such lenses had been long in use by watchmakers and in the construction of certain optical instruments. His attention was called to the subject more than a year ago by a friend, a distinguished surgeon of New York, upon whom had been performed a successful cataract operation. The usual glasses, if he remembered correctly, gave perfect satisfaction. After a secondary operation for capsular remains, the patient found difficulty in adjusting spherical glasses. He then experimented with cylindrical lenses with great satisfaction. There is reason to believe that this patient is one of the first who ever wore such a combination as being superior to spherical lenses. The patient, after visiting some of

¹ Since the above was written Drs. Noyes and Roosa (New York express an experience similar to Dr. Coleman's in the substituting of a plus cylinder glass in simple slight my opic astigmatism.

the European clinics, was led to believe that few, if any, of the teachers knew, by practical experience, that such cataract glasses were advantageous to some patients. Experience must determine whether the slightly less spherical and chromatic aberration and the somewhat enlarged field of the cylindrical lens, such as was here presented, can be of special benefit to cataract patients, and those requiring strong positive lenses.

The an apron. Ether was used as an anæsthetic. The abdominal incision was about three inches in length, and the cyst was tapped and, as its contents escaped, it was drawn forward into the wound. When nearly empty it was freely incised, the hand introduced and a number of smaller cysts crushed, which diminished the tumor sufficiently in size so that it could be brought out of the wound. The pedicle was treated

THE PRESIDENT also presented a small INSTRUMENT FOR INCISING SECONDARY CAPSULAR CATARACT,

in cases in which iridectomy had been performed. The instrument is practically a very narrow Græfe's knife, bent on the flat at about half an inch from the point, making a right angle with a square shoulder. The metal portion of the handle is round and small, not unlike that of a cataract needle. The handle of the instrument, in operating, is held in position as in them were doing well. An old lady 78 years of age making the corneal incision for extraction of cataract. The point is carried through the periphery of the viously, and now insisted on leaving her bed, as she cornea into the anterior chamber, the plane of the insisted that she felt stronger and better than before knife being in the plane of the perpendicular meridian the operation. In one case the pelvic adhesions of the globe. A slight rotation of the handle carries the cutting edge of the instrument through the opaque capsule. Dr. Holmes had used this instrument in three cases with great success. In the fourth case, the very tough membrane was simply torn from its attachments and displaced. The wound in the cornea produced by the instrument is somewhat larger than that made by a stop needle. There is less violence, however, to the tissues than in cases in which it is necessary to make extensive motions with the handle of a stop needle or of Knapp's knife needle to ensure rupture of the membranes. An instrument right or left is required for each eye.

FOREIGN CORRESPONDENCE

LETTER FROM EDINBURGH.1

Skene Keith—Ovariotomy—Tapping Cysts of the Broad Ligament—Myo fibroma of the Uterus—Professor Chiene—Resection of Knee and Ankle—Amputation of Thigh—Resection of Hip—Professor Annandale—Resection of Knee—Tuberculosis of Knee—University of Edinburgh.

Dear Dr. Fenger:—I had the pleasure of witnessing an ovariotomy by Mr. Skene Keith, assisted by his father, Dr. Keith. Young Keith has inherited many of the good qualities of his father, and promises to become one of the most successful ovariotomists. I doubt if ever a man of his age could show such a record of cases as he has recently published, and it is only just to say that the statistics published by the Keiths can always be relied upon.

The patient was 74 years of age, and the tumor had been growing for two years and had been several times tapped. The cyst was large, and in the pelvis a number of hard nodules could be felt. The

and the cyst was tapped and, as its contents escaped, empty it was freely incised, the hand introduced and a number of smaller cysts crushed, which diminished the tumor sufficiently in size so that it could be brought ont of the wound. The pedicle was treated as above described, and after the removal of the clamp the compressed cauterized portion looked like a dry translucent membrane. A number of firm adhesions to the abdominal wall were carefully isolated, tied on each side and cut between the ligatures. The operation was done slowly and carefully, and afforded a good illustration of what is meant by conscientious scientific surgery. A number of convalescent patients were shown where abdominal section had been done for different indications, and all of had an ovarian tumor removed three weeks prewere so extensive and firm that only part of the tumor could be removed; the remainder was fixed in the wound and drained, and the patient was doing well and the tumor becoming smaller in size. Dr. Keith has observed numerous permanent cures after simple tapping of cysts of the broad ligament, and is in favor of resorting to this simple procedure in all such cases as a preliminary or tentative measure before exposing the patients to the increased risks of an abdominal section. In spite of his unparalleled results in the operative treatment of myo-fibroma of the uterus, he assured me that as his experience increased with this class of tumors the more he dreaded a radical operation. Dr. Keith is a representative conservative surgeon, but he can never be accused of possessing a "statistical conscience," as when the indications for an operation are clear to him he will never shrink from the responsibility of an operation, no matter how desperate the case may be, for the sake of improving his statistics. His fame is established, his record is made, and whatever his statistics in the future may be, the scientific world can rest assured that it is the result of honest, conscientious work. The second evening in Edinburgh I spent in the family of Dr. Keith, as I had been invited to dinner. I felt that I was surrounded by the blessings of a truly Christian home, and the evening was spent in discussing abdominal surgery. Although the weather was cold and a drizzling rain rendered out-door exceedingly unpleasant, the doctor insisted on accompanying me to the hotel, where he bade me an affectionate farewell, and I retired with pleasant thoughts of the many profitable hours spent in his genial presence.

While in Edinburgh I attended a lecture by Professor John Chiene, on Resection of Knee and Ankle-joint, and Amputations of Thigh. After resection of knee-joint he does not resort to any immediate measures to secure coaptation and immobilization, but relies on extension by means of weights and pulley,

GALVANIC MEASUREMENT.

Dear Sir:—I have before me copies of THE JOUR-NAL of April 23 and May 7. The former opens with "Treatment of Fibroid Tumors of the Uterus by Electrolysis, with a Description of Apostoli's Method," by Franklin H. Martin, M.D. Both numbers ceived by the indications of his absolute milliampèrecontain articles under Domestic Correspondence enti- meter; for if his patient was constituted of pure tled "Galvanic Measurement." That of the former copper in abdominal section, and in possession of a being also by Dr. Martin, and of the latter by Dr. uterus of the same material, the impossibility would read a paper by Apostoli, describing his method of pères, even with a thousand cells of ordinary crowtreating uterine fibroids by powerful electrolysis, foot battery gravity, connected in series. and a subsequent paper by the same author "On a especially Endo-metritis, by the Intra-Uterine Chem. on one tumor with very great depth of uterus, a curical Galvano-Caustic." This is a translation as it rent of 10 ampères, I can only say, "The cake is appeared in the Boston Medical and Surgical Jour- his'n, because he took it." It seems to me like a nal of April 21, in which currents as high as 200 bad case of extra-uterine astigmatism! milliampères are mentioned.

which are to be found in the above-mentioned pa- notice the following: "Granting a deep uterus and pers, I believe to be of the greatest importance to thin abdominal walls, the tissues intervening between physicians in general, especially to those who em- the electrodes offer a resistance of about 60 ohms." ploy the galvanic current in their treatment of certain cases. Ohm's Law, which is as well established cal Journal, translated from Dr. Apostoli, where 200 as the multiplication table, and which enables us to locate exactly a fault in an ocean cable, expresses 30 Leclanche elements, which would indicate a rethe following fact: Electro-motive force divided by resistance equals current—Electro-motive force in volts, resistance in ohms, and current in ampères; these being the electrical units, the formula being $\frac{E}{E} = C$, and by deduction $E = C \times R$ and $R = \frac{E}{C}$ of a flat platinum uterine probe properly inserted Thus, knowing any two of these factors, the third is amounted to over 600 ohms. Undoubtedly a great easily obtained.

Electro-motive forces of batteries vary with the materials employed, and not with the quantity of material; for example, E. M. F. of the Law cell is 1.4 volts, of Leclanche 1.5 volts, of chloride of silver cell 1.06 volts, of gravity 1.079 volts; whether the cells be an inch high or a mile high. E. M. F., however, increases directly as the number of cells connected up, in series. Resistance includes internal resistance of the battery, the resistance of conequal at all parts of the circuit.

Dr. Martin's article says: "The current of elecble the E. M. F. is necessary.

Again he says: "The maximum current that can tery composed of 115 gravity cells" In another place he says: "The results of my experiments have led me to adopt for office purposes the ordinary crowfoot gravity cells." In a note to the "1,000 milliampère" paragraph he states: "Since writing the above I have been able to use still higher currents in special cases;" and also states that "These cells are coupled in tandem," by which I judge that he means connected in series. I am afraid he has been de-Engelmann, of St. Louis, Mo. I have also carefully still remain of passing a current of 1,000 milliam-

But when, in the article on "Galvanic Measure-New Method of Treatment of Chronic Metritis, and ment," page 472, Dr. Martin states that he had used

In the article on "Galvanic Measure," by Dr. A careful consideration of some of the statements Geo. J. Engelmann, in The JOURNAL of May 7, I Also in the article in the Boston Medical and Surgimilliampères are said to be obtained by employing sistance between electrodes of about 200 ohms, and this without counting resistance of milliamperemeter. To the writer these resistances seem too small, though his opportunities for making these measurements have been very limited. A contact resistance alone variation in resistance will be observed with different subjects, as well as character of both electrodes.

Very truly yours, H. L. Bailey, *Electrician*. 112 Liberty Street, New York, May 10, 1887.

BRANCHES OF THE AMERICAN MEDICAL ASSOCIATION.

Dear Sir:—In view of the fact that at the coming necting wires, milliampèremeter, tissues, etc.; in meeting of the Association, a special Committee on fact, whatever is in the electrical circuit. Current is the "Branch question" will submit its report, it seems strange that members who may not be present should refrain from expressing their opinions beforehand. tricity used in electrolytic therapeutics should be The question is open for discussion, yet, from the one of moderate quantity compared to the intensi-silence in your columns, it would appear that the last ty." He is here making use of obsolete terms to words on this subject had been written. Your corexpress the idea of currents derived from sources of respondents last year were more engaged in devising high or low electromotive force. The facts are these: the means by which a change could be made than in The effects of equal currents are equal. To obtain | demonstrating its fitness or advisability. This is the the same current through double the resistance, dou-least advantageous method of bringing the question to an issue; the first point should be the establish-

ment of a case. Those who advocate the change do quent place of meeting." I trust that, during the thorough and practical organization; and of affording your readers. The age is one of progression, and a means through which an expression of opinion, or this occasion demands that steps should be taken to a policy, could first be shaped within the body, and furnish means of attainment commensurate with the then authoritatively projected beyond. The question | broad prospects of the American Medical Association. at the bottom of this matter is medico-political rather than scientific, and the end to give the profession status as a vital factor in political life. There is no country where organization is more respected or has greater practical influence than in the United States, and when a plan can be devised which is in harmony with existing institutions and the system of representative government, its adoption will hardly fail to be advantageous. Instances have been cited in which the influence of the Association has been successfully employed in the past to great professional advantage; yet we are forced to believe that these successes were due more to the personality of the advocates than to the weight of a resolution or series of resolutions passed at the annual meetings of a scientific body. Cannot these achievements be taken as an earnest of what may be done when the means tions of Ptomaines and Leucomaines, and whatever are provided? The Association now possesses within else may throw light upon intimate Pathological itself the elements necessary for a progression which processes. would be unequalled in professional annals. the assistance of THE JOURNAL it has already demonstrated a renewed vitality; and it only requires a system of organization to make it what it might be, apparatus for Bacteria Culture are solicited. the most powerful medical association in existence.

It is a mere matter of theory that affiliated local are desired: and State societies contribute more than moral strength or support. Their members are not members of the Association in fact, nor is the treasury enriched by a single direct contribution. financial aspect of this question of reorganization could be placed upon a sound and equitable basis, most of the fancied objections to real progress would be removed.

It has been claimed that the present system of mens and culture preparations. representation by delegates who alone have the power to vote, accomplishes all that is sought from representatives duly elected by Branches; yet it appears ologist and Microscopist—such as test objects to illusthat practically the suffrage is not so limited. A letter from an "Old Member" of the Association which appeared in The Sacramento Medical Times, of May, 1887, gives evidence of a different character. The writer says: "Where the necessity arises for legislative action, both registered and unregistered delegates, as well as Permanent Members who have no right to vote, indiscriminately exercise it, thought-lessly or indifferently." Presuming that the writer knows whereof he speaks, it would seem that the delegate representation system is not by any means! the safeguard that it purports to be. Admitting, however, that this is a rare occurrence, a grave and inseparable disadvantage still remains—and one which The writer adds: "Moreover, with a system where a preservation and safe return. numerical attendance dependent upon locality has preceding years, or may be overruled at some subset the address of Edward M. Schaeffer, M.D., Washing-

so in the expectation of extending the power and in-interval which still remains, those who believe in the fluence of the Association; of rendering possible a innovation will place their side of the question before WESTWARD Ho.

INTERNATIONAL CONGRESS.

NINTH INTERNATIONAL MEDICAL CONGRESS.

Section 9, of Pathology, Microscopical and Pathological Exhibit.

In connection with the Section of Pathology at the approaching meeting of the International Medical Congress to be held in Washington, D. C. (U.S.), commencing on September 5, 1887, there will be an exhibit of objects relating to Microscopical Anatomy and Pathology, including Bacteriology, and illustra-

In order to make the exhibit as complete as possible, the loan of Microscopical preparations, the instruments and agents for preparing them, and the

The means illustrative of the following subjects

- a. Human and Comparative Histology, morbid and healthy, as illustrating Pathology.
 - b. Morbid Growths, benign and malignant. c. Embryology, human and comparative.
- d. The development and Pathology of Nervous Matter, of Brain, Spinal Cord, and Peripheral Nerves.
 - e. Epizoa and Entozoa.
- f. Pathogenic Microbes, both discovered speci-
- g. Impurities in water liable to be used for drinking.
- h. Miscellaneous objects of interest to the Pathtrate the working powers of particular lenses, Microscopical appliances, Bacteriological apparatus, etc.
- i. Pathological specimens of moderate size to be examined without the microscope, are desired.

Competent persons will be secured to assist in the proper exhibition of objects. Those who forward objects for exhibition and intend to be present at the Congress, are requested to take charge of their own specimens during the hours of exhibition. Others, who are willing to take charge in the same manner of such specimens as the Committee in charge of the exhibit may assign them, are requested to notify the Chairman as early as possible.

All preparations and apparatus will be regarded as has been keenly felt by the Association very recently. Joans, and care will be taken to secure their proper

All persons willing to contribute to the exhibit legislative power, there can be no fixed policy, as the are requested to forward a list of the objects, they conclusions of one year may be contrary to those of propose to display, at as early a date as possible, to

ton, D. C. (U. S. A.), Chairman of the Committee in charge of the exhibit.

and on receipt will be at once acknowledged by the Committee, and those selected for exhibition will be included in the catalogue of the exhibit. The Committee can only be responsible for exercising proper care of articles received.

The President and other officers of the Section of Pathology request further contributions to the Section on any pathological subjects, but are particularly desirous of articles on the Pathological Relations of Ptomaines and Leucomaines, the Morbid Anatomy and Pathology of Alcoholism, the Etiology and Pathology of Cholera and Yellow Fever, the Pathology of Tubercle and Tuberculosis, the Influence Section on Ophthalmology, Otology and Laryngology. of Inhibition in Inducing and Modifying Pathological processes; and, in connection with the exhibits, records of the Section.

A. B. Palmer, M.D., L.L.D., President of the Section of Pathology. E. M. Schaeffer, M.D., Chairman of the Committee on the Exhibit.

Transatlantic Rates.—In the Revue Générale de Clinique et de Thérapeutique, we notice the following in regard to special rates for physicians coming from France to the International Congress: "In a letter addressed to various journals, M. Dujardin-Beaumetz announces that the Compagnie Transatlantique will carry French physicians to the International Medical Congress in America at a reduction of 30 per cent., making the fare 700 francs (\$140) over and return, first class.

ASSOCIATION ITEMS.

AMERICAN MEDICAL ASSOCIATION.

Chicago, Ill., commencing on Tuesday, June 7, at 11 A.M., in Central Music Hall, corner of State and Randolph streets, and will continue four days. Good rooms for the several Sections will be provided as near the hall for general meetings as possible. Registration books will be open in Central Music Hall on Monday, the day preceding the meeting, for those who wish to register early.

In addition to the list of papers already published, the following are promised:

Section on Practice of Medicine, Materia Medica and Physiology.

R. W. Seay, Pilcher's Point, La., on "Aids in the Prevention of Fevers;" Wm. B. Fletcher, Indianapolis, Ind., "Diseases of the Dura Mater Producing Motor Paralysis, Facial Spasm, and Neuralgias, etc.

Henry J. Reynolds, of Chicago, "A New Method of Producing Local Anæsthesia of the Skin."

John V. Shoemaker, of Philadelphia, "Geranium Maculatum."

E. C. Spitzka, of New York City, "Acute Fatal Delirium; Its Differential Relations."

Section on Obstetrics and Diseases of Women.

A. McLaren, St. Paul, Minn., "The Relationship All preparations may be sent to the same address, between Puerperal Fever and Erysipelas in Both its Acute and Dormant Forms."

> L. Ch. Boislinière, St. Louis, Mo., "The Management of Occipito-Posterior Positions."

> E. W. Cushing, Boston, Mass., "The Use of the Buried Continuous Animal Suture in Laparotomy and in Perincorrhaphy."

> Fayette Dunlap, Danville, Ky., "Sudden Death in Labor and Childbed."

> > Section on Surgery and Anatomy.

Henry C. Beenning, Philadelphia, Pa., "On Some Points in Human Anatomy."

J. E. Harper, Chicago, Ill., "The Causative Relation of Ametropia to Ocular Disease;" E. Fletcher descriptions and essays which may go into the Ingals, Chicago, Ill., "On Suppurative Inflammation of the Antrum of Highmore.

> Railway Rates.—Arrangements have been made by which delegates living on trunk lines may apply for blank certificates to Dr. Liston H. Montgomery, of Chicago, Chairman of Committee on Transportation. Delegates should name the line of railway over which they will travel when making the request. Dr. Montgomery will sign all return certificates, and no deviation in this matter can be permitted. Some member of the Transportation Committee will be always present at the meeting to give information.

> > LISTON H. MONTGOMERY, Chairman Com. on Transportation.

RAILROAD RATES.

Dr. Liston H. Montgomery, Chairman of the Transportation Committee, has received the following communication from the General Passenger and Ticket Agent of the Northern Pacific R. R.:

The Thirty eighth Annual Session will be held in say, that to members of the American Medical Association in attendance at the convention in Chicago from June 7 to 10, we will issue Return Tickets from St. Paul or Minneapolis to points on our line in Dakota only, at One-Fifth Fare for the return trip. These delegates, in going to Chicago, must be instructed to purchase of Northern Pacific agents first-class tickets from starting-point to St. Paul, and take receipt therefor of our Attached to this receipt is a certificate which certifies agents. to their attendance at the convention. These you must fill up, and attach your signature thereto.

On presentation of such receipt and certificate to our agents at St. Paul and Minneapolis Union Depots, or to B. N. Austin, No. 19 Nicollet House Block, Minneapolis, or C. E. Stone, 169 East Third St., St. Paul, return tickets at one fifth fare will be issued as above.

We cannot make delegate excursion rates returning from St. Paul to points in Minnesota under the Minnesota State law.

Please advise me if fully understood, and if you will see that delegates to the convention from points on our line are fully instructed as to the method of procedure. Yours truly, CHARLES S. FEE,

Gen. Passenger and Ticket Agent. The St. Paul, Minneapolis & Manitoba R. R. has agreed practically to the same concession as its competitor, the North-

ern Pacific, viz.: that of one fifth fare to return; but it is believed, in this instance, to apply to Minnesota delegates as well. N. B. In any case, however, delegates must take receipt of agent of whom going ticket is purchased. Ticket agents along

this line will be supplied with a combined certificate and receipt,

to he issued upon application of the passenger purchasing oneway unlimited ticket.

Only those in actual attendance at the meeting of the American Medical Association will be given certificates to return, the aggregate of which must at least be twenty persons who pay full fare "going," along this line.

The Committee on Transportation appreciate the above courtesies, and trust our Minnesota and Dakota friends will find it

convenient to avail themselves of same.

LISTON H. MONTGOMERY, Chairman Com. on Transportation.

MISCELLANEOUS.

THE ST. CHARLES CO. (Mo.) MEDICAL SOCIETY was organized at Wentzville, Mo., on May 17. following were chosen officers for the ensuing year:

President—J. A. Talley, Wentzville, Mo. Vice-President—J. C. Edwards, Cottleville, Mo. Secretary—H. H. Vinke, St. Charles, Mo.

Treasurer-M. D. Carter, New Melle.

The most interesting part of the proceedings was a report by Dr. Edward Tallev, of Wentzville, on "The Treatment of Tuberculosis by Bergeon's Meth-Dr. Talley is unfortunately suffering from phthisis himself, but stated that since the employment of Bergeon's treatment cough, expectoration, night sweats and other distressing symptoms have been materially improved, and that he is in hopes of being perfectly cured.

STATE MEDICAL SOCIETY OF ARKANSAS, will hold its next annual session at Little Rock, June 1, 2 and 3, 1887. President, James A. Dibrell, Sr., M.D.; L. P. Gibson, M.D., Secretary.

OHIO STATE MEDICAL SOCIETY, will hold its next annual meeting at Toledo, June 15, 16 and 17, 1887. Thos. McEbright, M.D., President; G. A. Collamore, M.D., Toledo, Secretary.

YELLOW FEVER IN FLORIDA.—A dispatch from Key West, of May 23, says: Mr. Baker, who was declared Saturday to be suffering from yellow fever, died this morning. His wife, who contracted the disease a few days later, also died to-day and was buried a few hours after her husband. Both developed the most malignant symptoms. A sister of Mrs. Baker, who lived in the same house, which is in the principal street in the heart of the city, is also down with fever, but her case is not hopeless. The disease is undoubtedly traced to some bedding recently brought from Havana. Several other suspicious cases are said to exist.

HEALTH IN MICHIGAN.—For the Month of April, 1887, compared with the preceding month, the reports indicate that tonsilitis, erysipelas, measles, diphtheria, and influenza decreased in prevalence. Compared with the preceding month the temperature in the month of April, 1887, was much higher, the absolute humidity was much more, the relative humidity was much less, and the day and the night ozone were slightly less. Compared with the average for the month of April in the nine years, 1879-1887, intermittent fever, diphtheria, remittent fever, scarlet Asst. Surgeon in the Navy, May 19.

fever, pneumonia, consumption of lungs, influenza and bronchitis were less prevalent in April, 1887.

For the month of April, 1887, compared with the average of corresponding months for the nine years, 1879–1887, the temperature was slightly lower, the absolute and the relative humidity were slightly more, the day ozone was about the same, the night ozone was considerably less. Including reports by regular observers and others diphtheria was reported present in Michigan, in the month of April, 1887, at twenty-five places, scarlet fever at thirty-nine places, typhoid fever at eight places, and measles at thirtysix places. Reports from all sources show diphtheria reported at twenty-one places less, scarlet fever at thirteen places less, typhoid fever at five places less, and measles at one place more in the month of April, 1887, than in the preceding month.

THE PRACTICE OF MEDICINE BY APOTHECARIES IN Pennsylvania.—At a meeting of the Philadelphia County Medical Society, held February 23, 1887, it was resolved to address to the Senators and Representatives from Philadelphia County, and to the Governor of the Commonwealth, a communication signed by the President and Recording Secretary of the Society, requesting them to oppose and to disapprove of the passage of Section 10 of the proposed Pharmacy Law now pending before the Legislature of Pennsylvania. This section so far repeals the Registration Act as to permit druggists to engage in the practice of medicine, provided that they conduct only an office practice.

OFFICIAL LIST OF CHANGES IN THE STATIONS AND DUTIES OF OFFICERS SERVING IN THE MEDICAL DEPARTMENT, U. S. ARMY, FROM MAY 14, 1887, TO MAY 20, 1887

Major Morse K. Taylor, Surgeon, retired from active service, May 14, 1887. S. O. 111, A. G. O., May 14, 1887. White, R. H., promoted to be Surgeon with the rank of Major,

to take effect from May 14, 1887. Capt. Jno. D. Hall, Asst. Surgeon, granted leave of absence for one month, with permission to apply for one month's extension. S. O. 74, Dept. Col., May it, 1887. Suter, William N., appointed Asst. Surgeon, U. S. Army, with

the rank of First Lieut.; to rank as such from May 16, 1887.

OFFICIAL LIST OF CHANGES IN THE MEDICAL CORPS OF THE U. S. NAVV, DURING THE WEEK ENDING MAY 21, 1887.

Curtis, L. W., P. A. Surgeon, ordered to the "Quinnebaug." Baker, J. W., P. A. Surgeon, ordered to the hospital, Chelsea,

OUR POSTERITY.

The Address of the Retiring President before the Allegheny County Medical Society, April 19, 1887.

BY JOHN M. BATTEN, M.D.,

OF HITTSEURGH, IA.

The constitution of this Society makes it obligatory upon the retiring President to deliver an address on medicine or one of kindred topics. The subject of my address has been treated of before more ably development, morally, intellectually and physically, than I could even hope to do; but the good results from frequent presentment of a subject will as surely follow as will the wearing of the granite stone follow the constant falling of raindrops upon it. The subject which I wish to present for your consideration to-day is

OUR POSTERITY.

just as pertinent a question now as it was two thous but his children and his grandchildren who inherit and years ago. My object principally, in this address, A.'s wife's inferior physical, intellectual and moral is to make a few remarks, briefly, bearing upon the development will, according to the laws of heredity, laws of heredity, upon the great importance of proper descend below A.'s plane of development. The selection, and upon a correct system of education of question might be asked: Would it be possible for

each generation, in all civilized countries, there have plane from which they had descended? I believe risen to the surface a few men who are the ideals of the answer to this question might be made truthfully perfection, physically, intellectually and morally. If in the affirmative; that is, if a wise vigilance was exthe ancestry of such men were traced, it would be ercised in their selection. For example, suppose A. found that they were the offspring of parents for several generations who presented just such qualities lectual and physical development, should each make with which their descendants were endowed. Sup a selection—the former of C. and the latter of D. pose A. was one of these ideal men; it is likely that The plane of D.'s development is far below that of his father and mother were persons above the average C.'s. The law of heredity would place B.'s children physical, intellectual and moral development, and on a plane of development far below that of A.'s; that their parents were blessed with the same attri and consequently, in order that B.'s children should butes. We have had many instances in our own rise to the plane of development of A.'s children, it country where an A. rose to a position of eminence, would require many generations, even though wise power and trust in which he exercised a mighty influ-selections were made. ence in church or in State, and justly so, by having An exception to the above law might be when B.'s inherited a good moral, intellectual, and physical de-children would inherit the constitution of the father, velopment. development if they and their descendants continue institutions, which are now dotted thickly all over become extinct before many generations.

death, in an address at the dedication of the Mc-Builders and the Indian races? Dowell monument, after discussing the importance of skilful and successful laparotomy operations, skilful and successful operations for stone, and skill and success in other capital operations, said: "But the question of skill and success in capital operations problem of the people's welfare." He further said: "The day has arrived when the people must be aroused to a deeper and a more earnest sense of the people's welfare, and suitable measures adopted for the protection as well as the better development of their physical, moral and intellectual powers. This is the great problem of the day, the question which you, as the representatives of the rising generation of physicians, should urge in season and out of season upon the attention of your fellow citizens; the question which alone and beyond all others should engage your most serious thoughts and elicit your most earnest coöperation.'

Consequently, no father should suffer his son or his daughter to marry a person who could not present him with a satisfactory certificate from a competent physician as to the physical fitness of that person for marriage. No license should be granted to a removal of a molecular opacity, which was not by county or State officials to any individual without a recognizable upon ophthalmoscopic examination. like satisfactory certificate. In fact, the State Board of Health, in each State, composed of competent physicians, after careful examination, should issue such certificates to applicants. The family history of candidates for matrimony should be well studied by parties its importance justifies further careful experiments, most interested, and by physicians granting such mainly with reference to beginning cataract. In certificates. If more attention were paid to proper 1879, or before, my attention was called to the use selection, and to a correct system of education of of electricity as a remedy for the treatment of catthe people's physical, intellectual and moral powers, aract. The following case came under my obserthere would be no need for so many eleemosynary vation:

to remain denizens thereof, for it has been said, and our land; there would be fewer courts of justice I believe observation bears out the truthfulness of the needed, and consequently fewer prisons. Much sufassertion, that if an embarriment were placed around fering would be prevented; there would be happier a large city preventing healthy, robust recruits from homes, and in the end America would be populated the country, the inhabitants of such a city would by a more robust, a more intellectual, and a more noble people. By our present mode of selection, I In these times of such a craze for wealth, and might say, as I wrote on a kindred subject six years power, and fame, the powers of the intellect are so ago, that if it were not that every birth is a regenerpressed at the expense of the body that endurance ation, and were the constitutional diseases which disceases, causing in many wrecked constitutions, if not eased parents transmit to their offspring not modified premature deaths. With such there should be called by an inalienable bequest of an older world, and by a halt, and less work and more recreation before it is the redeeming instincts which our All Mother grants too late, if they would prevent themselves and their to every new-born child on earth, the people of the posterity from being placed on the descending scale world long ere this would have become extinct. THE GALVANIC CURRENT IN THE TREATMENT OF CERTAIN FORMS OF CATARACT.

sinks into insignificance compared with the great Read before the Chicago Society of Orththalmology and Otology, February 8, 1887,

BY J. ELLIOTT COLBURN, M.D.,

PROFESSOR OF OPHTHALMOLOGY AND OTOLOGY IN THE CHICAGO POL-ICLINIC; ASSISTANT SURGEON TO ILLINOIS CHARITABLE EYE AND EAR INFIRMARY, ETC.

The following extract is from Erb's "Handbook of Electro-Therapeutics:" "Among diseases of the lens, cataract has been drawn recently into the field of electro-therapeutics. Neftel created no little excitement in the ophthalmological camp by a report of two cases of undoubted beginning cataract, in which all the symptoms of the cataract were relieved by methodical galvanic treatment, and visual power restored completely. After a sharp criticism of these statements by Hirschberg, Neftel acknowledged that the opacities of the lens, demonstrable with the ophthalmoscope, had not disappeared entirely, and explained the undoubted improvement of the eyesight He adds also that galvanic applications exert an influence, though not to any great extent, upon the opacities of ripe cataracts.'

This subject is, therefore, still in its infancy, but

Mrs. G., aged 53, consulted me for general debilture of both limbs; the sister's, at the age of 57 developed in right eye. years, following an operation for fibroid tumor. One with correcting glass; left eye, vision equals Snellen provement. Lately successfully operated. diagram:

As she had for a long time been under the careful management of a good practitioner, and the whole range of tonics and stimulants had been exhausted, I concluded to try central galvanization, as recommended by Beard and Rockwell in their first edition. To my great satisfaction my patient responded to the treatment, and in three months had gained fifteen pounds in flesh and greatly in general vigor. While attending to another member of the family I found my former patient reading, and much to my astonishment found it to be Milton's Paradise Lost, in small print. I again made an examination of the eye under atropine, with the oblique illumination, giving the results as in sketch No. 2.

Soon after this case had passed from my observation my attention was called to the papers of Neftel and others, with the discussion. This and the doubt that these papers engendered, has tended to make me slow in giving to the profession the results of $Casc \neq -1881$. Mr. D., aged 63. R. V. = $\frac{15}{100}$, my limited experience and study in the treatment of L. V. = $\frac{15}{200}$. Peripheral cataract. Three long lines me slow in giving to the profession the results of incipient cataract by the use of the galvanic current of electricity. I doubt if I should have done so now, but for reasons which I cannot here mention, and to prevent being misunderstood by my professional friends and associates. The following are the cases as taken from my notes. I have arranged my cases in the following groups:

Group 1 includes those cases in which there was no improvement, as follows:

Case 1.—1881. Mrs. La L., aged 49. R. V. = $\frac{15}{80}$, ity, loss of vision, and catarrhal conjunctivitis. She L. V. = $\frac{1}{100}$. Peripheral cataract both eyes. Long had been in poor health for seven years, following narrow spikes extending to centre of lenses, no nebthe climacteric period. There was no evidence of ulæ. No change in vision for two years. Previous organic disease of the viscera. Her family history health good. Three years previous had fracture of was good, with the exception that one aunt, a brother right arm and amputation of hand at wrist. Peripheral cataract. Two long spikes and and thread a needle. The right eye had been out many short ones in each lens, also what seems to be of use for some time, and had been slightly irritated a calcareous deposit at the periphera of lenses, much and "weeping." Examination with the oblique illu- nebular matter. Has atheromatous degeneration of mination gave the results indicated in the following arteries and valvular heart-lesions. Could get no definite results with the ophthalmoscope. Treated six weeks, eighteen sittings. R. V. = $\frac{20}{20}$. L. V. = $\frac{20}{40}$. Six months later R. V. = $\frac{20}{100}$, L. V. = $\frac{20}{80}$. Group 2 includes cases that have been under

observation from four to seven years, in which the

improvement has been permanent.

Case 1.—1879. Mrs. McC., aged 50. R. V. = $\frac{15}{100}$, L.V.= $\frac{15}{60}$. Peripheral cataract. Dense nebulæ about lines. Vision had diminished slowly for past 4 months, following carbuncle of the neck; in other respects health good. Under treatment two months, R. V. $=\frac{20}{30}$., L. V. $=\frac{20}{20}$. Six and one-half years later there was no perceptible loss of vision.

Case 2.—1880. Mrs. G., aged 52. R. V. $=\frac{15}{40}$, L. V. = $\frac{15}{60}$. Peripheral cataract. A few short lines and nebulæ extending far toward centre of lenses. Vision had diminished rapidly for two months. Had noticed "weeping" in left eye for six months. Nine months previously had pneumonia. Treated two months, R. V. = $\frac{15}{30}$, L. V. = $\frac{15}{15}$. Extensive spot of choroidal atrophy just at junction of right and left lower field, near ciliary region. Four years later reported no loss of vision.

Case 3.—1880. Mrs. L., aged 57. R. V. = $\frac{2.0}{0.0}$, L. V. with reading correction $+\frac{1}{1.0}$ = Snellen No. 10. Peripheral cataract. Long lines and dense nebulæ. Has been in poor health for past four months. First noticed loss of vision two months ago. Under treatment four months, forty sittings, R. V. = $\frac{20}{60}$, L. V. = $\frac{20}{60}$. With correction reading vision equals No. 3, Snellen. Eighteen months later, vision and health improved.

and many short ones, with dense nebulæ in each lens. Cannot read with correcting glasses. change in vision for six months previous. In better health than during preceding winter. Treated two months, R. V. = $\frac{1.5}{1.0}$, L. V. = $\frac{1.5}{1.00}$. Can read with correcting glasses. Two years later, no perceptible change in vision.

Case 5.—1883. Mrs. B., aged 70. R. V. = $\frac{15}{100}$, L. V. = $\frac{15}{6}$. Left eye with correction reading vi-

sion equals No. 5, Snellen. Right eye, two long Case 2.—July, 1886. Mrs. F., aged 68. Myopic. lines meeting at centre of lens form a V, and many R. V. = $\frac{20}{100}$, L. V. = $\frac{20}{200}$. Reading glasses, R. short lines, all the lines surrounded by nebulæ, more $\frac{1}{100}$, L. $\frac{1}{100}$. Slight cataractous radii in both or less dense; left eye, one long line and many short lenses. Has much trouble from loss of sleep, uses Treated four months, R. V. = $\frac{15}{30}$, L. V. = $\frac{15}{20}$. With can see no lines nor nebulæ, correcting glasses reads Snellen, No. 1; can thread — In all cases in which I have a fine needle and do fine sewing.

ripheral cataract, more marked in left eye than in long considered it a legitimate treatment. In my right. Was examined in January, 1883 (six months first cases 1 did not make the discrimination that previous), with diagnosis of cataract in left eye. Had Wells offers as to the rapidity or stasis of developmalarial fever in March, and when convalescing no ment of catatact, for I had not learned to fully meas-

complete removal of short lines and nebulæ.

ripheral cataract in both eyes. Right eye, three long is slowly absorbed, leaving the former gray portions spikes reaching nearly to centre of lens and surrounded by dense nebule. Left eye, one long spike clearly marked. I have never seen radii that were reaching to centre of lens, and many short ones; already fully degenerated, become absorbed or slight nebulæ. General health fair; lately devel changed more than could be accounted for by the under treatment, twenty three sittings, $V_{-} = \frac{2}{2} \frac{n}{n}$ in would expect arrested development, there was abso-both eyes, with $+\frac{1}{12}$ correction reads Snellen, No. lutely no change nor improvement of vision, except in vision.

Case 2.—1883. Mr. L., aged 54. R. V. $\frac{15}{40}$, L. V. 14. Short lines and nebulæ in both lenses; much lens, there can be but one opinion; that it is the disdepressed from loss of property; has labored hard turbance of nutrition, through functional and organic for last four years. Regular daily treatment for changes in the uveal tract, nerve and retina, and that three weeks and occasional treatments for two these changes may be associated with, and are usually months; at end of two months no lines and no neb-due to, some general disturbance of nutrition. In uke visible. Vision normal in both eyes. Two and thirty one cases which I have tabulated from my prione half years later, stronger correcting glasses gave vate work, and twenty-six from my outside or disnormal vision. No sign of degeneration of lens.

L. V. $= \frac{2.0}{3.00}$. With correcting glass reads Snellen, disease or an acute exacerbation of a chronic dis-No. 2. Had noticed loss of vision R. E. after pro-ease, or an exhausting mental depression or deprestracted confinement to house, from injury, L. E., fol-sion preceding the disturbance of vision, and in many lowing chicken-pox. After daily treatment for three cases attributed to it by the patients. In thirty per weeks, could see no lines nor nebulæ in left eye; in cent. of the cases there was evidence of choroidal the right eye nebulæ had cleared, leaving lines un degeneration, neuro-retinitis or retinal atrophy; changed. Four years later no appreciable change showing that it was not the lens alone that had been in either eye.

complete absorption of opacities.

Labor was induced seen under such conditions, believing it to be more permaturely for contracted pelvis three times, twice by the injection of water at 28° R. (95° F.) through a tube passed into the cavity of the uterus, between the uterine wall and the foetal membranes; in the third case it was induced by the introduction of an elastic sound into the uterus. Podalic version was performed eleven times, and the forceps applied fifteen times. Craniotomy was performed twice.—

Physiological Action of Spigelia.—Dr. H. A. Moscow, for the year 1886, the advantage of antiseptic HARE, of the University of Pennsylvania, in a study midwifery, which is strictly carried out there, is evi of physiological action of spigelia, or pink root, says: Some of the statistics, which are very carefully kept, poison, for if it be injected into the jugular vein in may be of interest. The largest number of births such a way as to come suddenly in direct contact

arterial pressure produced by this drug is due in great part to the cardiac depression which it produces is proved, since asphyxia will cause a rise in pressure, and that the pressure returns nearly to normal as soon as the heart gets rid of the drug which has been suddenly injected into it. On the respiratory centre the drug seems to have a still more depressing influence, respiration ceasing some moments before the cardiac arrest.—Medical News, March 12, 1887.

LIGATURE OF THE EXTERNAL CAROTID ARTERY. —In a paper describing three cases of ligature of the external carotid artery, in two of which both vessels were tied simultaneously, Dr. Joseph D. Bryant draws the following conclusions:

1. Ligature of the external carotid artery, to gether with dependent ligature of the branches arising from the first inch of its course, is a safe and

commendable operation.

2. When the facial and lingual arteries do not inch of the course of the external carotid, the branches arising at the point of bifurcation of the common carotid should be tied.

3. Simultaneous ligature of both external carotids is a rational preparatory measure for operations in volving the parts supplied by their branches when dangerous hemorrhage is feared. If the pharynx be involved, the ascending pharyngeal branches should be ligatured also.

4. Simultaneous ligature is advisable as a final expedient to diminish the rapidity of the development of extensive malignant growths when they are nourished by the branches of the external carotids.

- 5. Ligature of one or both of the external carotids for the cure of aneurismal formations of the branches of the same is not feasible as an independent curative measure.
- 6. Ligature of the common carotid should not be done for the cure or for the arrest of morbid conditions involving the external carotid or its branches, except as a final resort. — Medical News, May 14, 1887.

Carbolate of Mercury in Syphilis.—Dr. Karl SHADEK, of Kieff, being anxious to try the effects of carbolate of mercury, which has been strongly recommended in syphilis by Professor Gamberini, carbolate of potassium. A yellowish precipitate was British Medical Journal, May 7, 1887.

normally. At this time the powerful and heretofore obtained, which, after being frequently agitated with spreading systolic contractions seem to lose power the liquid for twenty-four hours, assumed a whitish and the heart shortly stops all movement in a semi-appearance. It was filtered and washed with dis-Experiments on the warm-blooded tilled water till the washings showed no traces of animal show that on the injection of one drachm, or chloride. It was then transferred to a fresh filter less, of the drug, the action of the heart is very paper and dried under a bell jar. The name given to it by Dr. Shadek after the drug has slowed the heart the vagi be cut, is "hydrargyrum carbolicum oxydatum," and he has the inhibition no longer remains. That the fall of been using it in his private practice for several months. At first he gave it in the form of pills, one of which, containing about an eighth of a grain, was ordered three, or occasionally four times a day. It was well borne, and did not interfere with the digestion. In some cases the treatment was continued for six or eight weeks, without producing colic or other disagreeable symptoms. The total number of syphilitic cases in which it was given internally was thirty-five (twenty-six men, six women and three young children). In five of these there was swelling of the gums and salivation. Mercury was found in the urine after the third dose. Its therapeutic value was especially remarkable in macular and tubercular syphilides and in syphilitic psoriasis of the palm and the sole. Syphilitic rash and slight relapsing forms yielded to the treatment in from two to four weeks; in syphilitic affections of the mucons membrane, and in papular and pustular eruptions, from four to six weeks were required. Multiple enlargements of glands were but little affected by it. arise singly, or by a common trunk from the first In the case of children from 2 to 4 years old, closes of about the fiftcenth of a grain were well borne twice daily.—Lancet, May 7, 1887.

> Transparitoneal Nephrectomy.—At a recent meeting of the Paris Surgical Society, M. Terrier communicated a note on a new method of performing transperitoneal nephrectomy. The abdomen is opened in the middle line, and the intestine pushed aside so as to uncover the peritoneal membrane covering the kidney A verticle incision is then made in the membrane, the edges of which are held back with clamps. After removal of the tumor, the pedicle and the ureter are tied and brought forward through the peritoneal incision to the abdominal wound, where they are secured. In this manner the peritoneal cavity is closed on all sides. M. Terrier claims that this operation does not necessitate drainage through the loin, as has generally been supposed. British Medical Journal, May 7, 1887.

XYLOL IN SMALL-POX.—OTVOES has used xylol in 315 cases of small pox with excellent results. This substance is recommended by Zuelza as an antiseptic; it coagulates albumen. Otvoes administered it in wine, in closes of 2 to 3 grammes a day. The total amount given was sometimes 24 grammes. requested M. H. Brandt, a pharmacist in Kieff, to Otvoes gives the following formula for the adminisprepare some for clinical use. This he did by tration of xylol: R. Pure xylol, 3 grammes; menthol precipitating a very dilute solution of bichloride of water, distilled water, aa 50 grammes; cinnamon mercury with a concentrated alcoholic solution of syrup, 10 grammes. One spoonful every two hours.

JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION. No. 65 RANDOLPH STREET,

CHICAGO, ILLINOIS,

SATURDAY, JUNE 4, 1887.

PUBLICATION OFFICE OF THE JOURNAL.

We again remind the members of the Profession who may be in the city during the meeting of the American Medical Association next week, that the business office is at No. 65 Randolph street, corner of State, in which they will find a clerk at all hours ready to wait upon them. Also, that THE JOURNAL printing office is at No. 68 Wabash avenue, only one square from the Central Music Hall, in which the Association will meet, where the extra volumes of the Transactions, published prior to 1883, are to be found and are for sale. Mr. White, in charge of that office, will be prepared to give any information concerning them that may be desired.

MECHANICAL TREATMENT OF HIP-JOINT DISEASE.

Of late years the attention of the profession has been so much directed to the operative treatment of hip joint disease, that the more conservative method of treatment of the affection has not received the attention merited by the attainable results. It is with pleasure, therefore, that we notice an interesting paper read before the New York Academy of Medicine, on May 5, "On the Ultimate Results of the Mechanical Treatment of Hip joint Disease. An Analysis of Fifty-one Cases, occurring in the Service of the New York Orthopædic Dispen-Robert W. Lovett, which may be found in the New returned to the dispensary service as soon as possible. York Medical Journal, of May 21. The cases upon

which the report was based were all dispensary cases, no hospital, private, or other cases being considered, and no cases in which the hip affection has been treated by other than mechanical means. It will be seen at once that the most difficult of all cases, dispensary, were selected. With the results obtained it is the object of the paper to show that it is not only possible but comparatively easy to treat hipjoint disease successfully, and satisfactorily with proper facilities; by which is meant a well equipped shop and a corps of mechanies to make, repair or alter the necessary appliances, and the cooperation of out-door visiting surgeons. A further object of the writers is to show that it is exceptional that homeless or illy cared for children require prolonged hospital care in hip-joint disease; and to show that a well-equipped orthopædic dispensary, if properly conducted, can do the work of several large hospitals at far less cost.

In order to arrive at positive and ultimate results when the investigation was begun, no case was to be considered which had not been under the care of the institution from the time of entry to that of final discharge; none which had been entered as "discharged cured" after a final examination; no case which had not been "discharged cured" at least four years prior to the investigation; none except those which presented unmistakable signs of the disease at the first examination; none which had not been at least two years under treatment; none which were not seen or examined after investigation was begun; and all cases within these exclusive conditions were to be classified and reported. These conditions, of course, excluded many interesting and valuable cases, but had the latter been included the facts brought out might have had less value. The general plan of treatment was as follows: In each case reported a long Taylor traction-splint was applied soon after the first examination, and the parents or some friends of the patient were instructed in the use of the apparatus. Unless recumbency was necessary to overcome a malposition of limb, or unless the symptoms were so acute as to demand rest (in which case the patient was visited at home by the visiting surgeon) the patient was allowed almost unlimited exercise in the open air. He was seen at the dispensary every week or two for observation and readjustment of the apparatus, etc. If the condition required recumbency for a month or more, and his home was inadequate, he was placed in one sary and Hospital," by Drs. Newton M. Shaffer and, of the wards of the institution, to be removed and

The aims of the treatment were to: 1. Overcome

by mechanical means any acquired deformity existing before treatment was begun. 2. Protect the is important to study the ultimate position of the diseased joint from traumatism. 3. Permit the pa-limb, so that, if ankylosis occurs, the most useful tient to have almost unrestricted out-door exercise. position will result. 4. This varies greatly in the throat. the different parts of the social scale. Thus Dr. chowdetermined by a microscopical examination that Grimshaw found that a thousand of the professional the growth is not carcinomatous. Dr. Morrell Macand independent classes included only seventy-five kenzie was called to Berlin to see the Prince, and it children under five years of age, while a thousand is said that his early arrival averted a thyrotomy. He of the artisan class contained one hundred and removed about two-thirds of the growth. Dr. Mactwenty one such children. further prove that the annual mortality among children under five years of age is five times as great honor, and shows that scientific worth is not estimaamong the working population as in the professional and independent classes. Further on in life the balance keeps in the same direction, though in a less degree. Special attention is drawn to the enormous waste of infant life among the working population. It is a striking fact that this "wholesale slaughter of the sickly and weakly children under five years of age" does not verify the favorite theory of many vital statisticians, that those who survive are capable of living long. That the children of the poor need not die so young is proved by the statistics of the Peabody Buildings, situated in various parts of London, and housing some twenty thousand persons belonging to the artisan and laboring classs. The low rate of child mortality in that instance shows that one cause of early death is to be found in the character of the dwellings, though to this must be added the habits of the people themselves. The Peabody population is assuredly living in a higher scale of civilization than the mass of the London poor, so far as personal conduct is concerned. There is abundant scope for the saving of child life among the poor, it is however a painful thought that the lives thus spared may help to swell that enormous mass of indigence which hangs already as a burden on the state. The solving of the sanitary problem will leave other problems to be faced, and will rather add to the complexity of some of these.

eminent members of the profession in the western part of New York, died at his home in Buffalo, May 24, 1887. He was born in Rochester, N. Y., in 1823. He graduated in medicine in 1848, and in 1853 accepted a professorship in the Medical Department of the University of Buffalo, and removed to that city, where he soon won a high reputation as a practitioner and teacher of medicine, and sustained it until his death.

SOCIETY PROCEEDINGS.

MEDICAL SOCIETY OF THE DISTRICT OF COLUMBIA.

Regular Meeting, March 23, 1887.

THE VICE-PRESIDENT, D. S. LAMB, M.D., IN THE CHAIR.

Dr. J. B. Hamilton gave the history and presented a specimen of

CANCER OF THE STOMACH AND PANCREAS.

The patient was a lady, 69 years of age, who first came under observation about three months ago, suffering from an injury to the hip joint. He found evidences of an old contusion, but there was general THOMAS F. ROCHESTER, M.D., one of the most debility and anorexia. On palpation, there was found a perceptible tumor in the left hypochondriac region, which seemed to be enlargement of the spleen. There was some pain, a little jaundice, but no vomiting. The patient was not seen again for about a month, when the jaundice had deepened, the pain had become more constant, there was complete anorexia, the patient had become greatly emaciated, and the tumor was projecting in the left hypochondrium. The symptoms intensified until last evening, when the patient died. There was considerable vomiting in the last two or three days of her life, and for the last twenty-four hours, there was characteristic black vomit, previous to which time it had not been positively demonstrated that the stomach was involved. The specimen showed carcinoma of the pancreas, and a large cancerous mass

The ball was located 8 inches to the and a wide flannel bandage completed the dressing. left of the median line and $1\frac{1}{2}$ inches above the level of the navel. There was moderate tenderness over and the temperature rose to 104°, but as the most the entire belly, hepatic dulness not changed, stomach careful examination revealed no spot of special tenresonant from fifth interspace, no cough, no râles, derness, no dulness, no fluctuation, and she was alvocal fremitus normal. Renal dulness began at tenth most, it seemed, in articulo mortis, it was not deemed rib on left side and was the same on the two sides. prudent to reopen the belly.

There was severe pain in the left shoulder. She had On the 10th she improved somewhat. On the 13th

the necessary wound of exit. None was to be found, Autopsy.—No adhesion of the parietal peritoneum but the manipulation showed that a small amount of extravasation was seen in the mesentery. But little blood had escaped into the peritoneal cavity. The nearly 18 inch in diameter in a large vein, so large and lax that at first I thought it the vena cava, but This was the third case in which the author had its position just below the head of the pancreas convinced me that it was a large superior mesenteric vein just before it forms the portal vein. After much difficulty I seized it with hæmostatic forceps, and placed a lateral ligature of chromicized catgut on it.

The anterior border of the liver had been scalloped alone. In addition, a large wound in a coil of small Dr. W. W. Keen, of Philadelphia, reported a intestine in the left flank had been found. Ten Lembert sutures were used in closing it. Returning now to the stomach, a very careful search was again made for the wound of exit. It was found obscured by a slight coating of blood. This was closed by three black silk Lembert sutures. 'A systematic investigation of the entire bowel from the stomach to the sigmoid flexure showed no other wounds. The left kidney was badly lacerated, and was immediately removed by peeling it out of its capsule and tying

On the 8th she had a chill lasting twelve minutes,

vomited 11/2 drachm of clear bright blood, she told she had another chill with a temperature of 105.4°,

had vomited several times, and also had some involuntary evacuations. But as her condition was fair, proposed this operation a few years ago the profespulse 136, temp. 101.4, the belly was reopened and sion were not ready to accept it. All are now preexplored. The intestines were bright and glistening pared to say that it is a proper measure to pursue, and no peritonitis existed. Surgical bimanual exam ination revealed no pus or special tenderness at the We have, as has been said, no positive signs of vissite of the removed kidney, or, so far as it could be ceral injury. free pus was found anywhere. Only one wound was Orleans showed that in the last five years there had found in the stomach, near the pylorus, and this was been thirty one cases of penetrating knife wounds healed, the four stitches being seen in place. The of the abdomen, of which twenty-four recovered and blood in the mesentery was disintegrating and suppurating, though no abscess existed, nor was there shot wounds of the abdomen, with thirteen recovany free pus in the peritoneal cavity. The suppuration was chiefly marked along the mesenteric attachment of the intestine. On the other side of the mesentery, corresponding in position to this wound, was a spot in the bowel wall as large as a five-cent coin, which was gangrenous, and in its centre were two perforations of the bowel. No wound was found except that discovered at the operation. No trouble was found at the site of the removed kidney. Although it was nearly ten hours from the accident to the time when the intestines and stomach were sutured, no intestinal or gastric juice or fluid escaped, though the intestinal wound was so large and vomiting occurred three times.

The kidney, I believe, has never before been removed at a laparotomy for gunshot wound, but it was clearly the right thing to do. The day following the operation the remaining kidney worked badly, only $3\frac{1}{2}$ ounces of albuminous urine being secreted. But the next two days dispelled all anxiety on this score, the urine rising to 24 and 40 ounces respectively, and the albumen soon disappeared. The early and

the most important point to determine is, when should performed. Antiseptic precautions were adopted. the abdominal cavity be opened? It was then emptied of its contents and of these signs there is much doubt. There is no opened. The sac was cut off close to the margin single symptom or collection of symptoms to be relied upon. He had been disposed to attach some value to the presence of profound depression of temperature. If the temperature remains subnormal four, five or six hours, penetration and perforation may be considered almost certain. Diagnostial laparotomy is admirable in certain cases. In private practice wound united rapidly. In October, examination of we have to be largely governed by the opinions of the wound showed it to be firmly united. The sutthe patient and his friends. Most of these cases necessarily involve legal investigation, and it is a very simple matter to show that death resulted not from the original injury but from the surgeon's knife. While he considered it wise to lay down the general rule that penetrating wounds of the abdomen, and still more perforating wounds of the viscera, should be submitted to laparotomy, at the same time he held that we are not justified in laying this down as a hard by S. W. Gross, of Philadelphia, was read by title. and fast rule.

Dr. Moses Gunn, of Chicago: When Dr. Sims but the only question is how to make the diagnosis?

Dr. T. G. RICHARDSON, of New Orleans, stated The autopsy revealed general peritonitis, but no that the statistics of the Charity Hospital of New seven died. There were thirty-three cases of guneries and twenty deaths. These cases were treated on the expectant plan.

> Dr. D. Haves Agnew, of Philadelphia, had very strong convictions in regard to laparotomy. He believed that where there is a reasonable degree of evidence that there is a penetrating wound of the abdominal wall, especially if a shot wound, it is the surgeon's duty to make an exploratory incision. We are not to be deterred by the possibility of some legal technicality if the case should come into court. We are to do our duty without reference to the consequences.

> Drs. David Prince, Joseph Ransohoff and N. P. Dandridge also reported cases bearing upon this discussion.

> Dr. J. Edwin Michael, of Baltimore, read a report of a case of

> VENTRAL HERNIA SUCCESSFULLY TREATED BY OPERA-TION, WITH A SUGGESTION AS TO THE METHOD OF OPERATING.

Mrs. F., stout woman, 45 years of age, had a marked compensatory enlargement of the right kid ventral hernia resulting from a fall several years preney is also of great interest and importance, though, viously. Great annoyance was experienced in the of course, now well known to follow nephrectomy. use of pads and bandages. The patient insisted on Dr. P. S. Conner, of Cincinnati, remarked that operation, and March 15, 1886, the operation was of the ring. Strong silver wire sutures were passed a little less than one half an inch apart, having a hold of one-half to three-fourths inch. The sutures included the peritoneal, muscular and tendinous structures only. These were twisted and perforated shot employed. The wire was then cut off close. The ures could be felt, but gave no inconvenience. In his remarks the speaker stated that his object in using the wire sutures in this manner was the expectation that they would be surrounded by a mass of cicatricial tissue, making a permanent closure of the ring. As far as he was aware, he had used the wire for this purpose without precedent.

A paper on Prognosis in Sarcomata of the Breast,

paper on

THE MEDICO-LEGAL ASPECT OF CRANIAL AND THORACIC WOUNDS (SUICIDAL).

The study of this subject had been suggested to him by a recent case occurring in Newport, Rhode Island. The question was as to the possibility of a cranial wound and a wound of the heart being selfinflicted. A colored man was found one morning lying dead under the breakfast-table. He had food in his mouth, and had a wound of the head and of the heart. The coroner's jury returned a verdict of suicide and the body was buried. Subsequently it was disinterred and the verdict reconsidered, and the conclusion reached that the man had been murdered. Suspicion then fell upon the son-in-law of the man, who had up to this time borne a good reputation. At the trial five medical experts were called for the prosecution, and their general testimony was that these wounds were incompatible with the idea of suicide. Subsequently the prisoner confessed that he had committed the murder. As this was an important question, the author had investigated it. Injury to the brain is not necessarily followed by loss of consciousness or by paralysis. Many cases were cited to show the truth of this statement. Numerous instances of heart injury were given in which, after the reception of the accident, the individual was able to perform many acts. Cases were also given in which persons, in attempting suicide, had produced injuries of the head and of the heart. As the result of his study the speaker concluded that it is possible for a ball to enter the brain without destroying consciousness, although for a moment it may cause mental confusion, and that a suicide may shoot himself in the head and after a moment shoot himself in the

In the discussion which followed numerous cases were related in which the heart or brain had been injured and the individual had lived for some time, and had not been unconscious. Cases were also given in which both a wound of the heart and of the brain had undoubtedly been produced by the individual himself.

> FRIDAY, MAY 13.—THIRD DAY. MORNING SESSION.

The following were elected

OFFICERS FOR THE ENSUING YEAR.

President—Dr. D. Hayes Agnew, of Philadelphia. Vice-Presidents—Dr. N. Senn, of Milwaukee, and Dr. F. S. Dennis, of New York.

Secretary—Dr. Jacob R. Weist, of Richmond, Ind. Treasurer - Dr. Phineas S. Conner, of Cincinnati. Recorder—Dr. J. Ewing Mears, of Philadelphia. Council—Drs. J. S. Billings, L. McLane Tiffany, Moses Gunn, and R. A. Kinloch.

Chairman of Committee of Arrangements—Dr. John S. Billings, of Washington.

The following were elected

NEW MEMBERS.

Charles B. Porter, M.D., of Boston; William M.

Dr. D. Hayes Agnew, of Philadelphia, read a Mastin, M.D., Mobile, Ala.; and Morris H. Richardson, M.D., Boston, Mass.

> The next meeting to be held at the call of the President.

> DR. L. McLane Tiffany, of Baltimore, read a paper on

SURGICAL DISEASES OF THE WHITE AND COLORED RACES COMPARED.

The paper was based on the record of 4930 cases, studied during a period of thirty-four months in a general hospital. The percentages of the affections were given in detail. The paper was simply intended as a preliminary communication, and as a result of a study of the figures obtained the following suggestions were made:

1. Surgical affections follow different courses in the white and colored races, under identical hygienic surroundings.

2. Surgical injuries and operations are better borne by negroes than by whites.

3. Surgical diseases involving the lymphatic system, especially tubercular, are more fatal and more rapidly fatal in negroes than in whites.

4. Congenital deformities are rarer in negroes than

in whites.

5. The surgical differences observed in whites and

negroes are due to racial peculiarities.

Dr. Christopher Johnston, of Baltimore, said that his experience indicates that there are individual as well as racial peculiarities. These are most striking in proportion to the pureness of the blood. He regarded the negro as a good subject for surgical operation. He had never seen carbuncle in negro. He does not recall a cleft palate or hare lip in the darker individuals. Epithelioma is infrequent. Fibromas are quite frequent. He had found that in the negro the skin and white tissues are more frequently the seat of certain diseases than the same tissues in the white.

Dr. T. H. RICHARDSON, of New Orleans, presented a detailed report of the statistics of the Charity Hospital, bearing upon this point. He had found congenital deformities rarely in the negro.

Dr. E. H. Gregory, of St. Louis, had seen keloid much more frequently in negro than in white, and had never seen multiple keloid in the white race. The ability of negroes to stand operation may be due to his indifference, and he does not comprehend the magnitude of the operation.

DR. W. T. BRIGGS, of Nashville, said that his experience confirmed the suggestions of Dr. Tiffany. Negroes are very prone to suppuration. It is extremely difficult to prevent suppuration even under strict antiseptic precaution. Negroes bear operations better than whites, but they do not get well so rapidly. While malformations are less frequent, still they do occur. The rarity of hydrocele in the hospital records may be explained by the fact that negroes do not usually seek advice until the tumor has become so large as to give rise to much inconvevience. Ovarian tumor is rare, although he had had

AFTERNOON SESSION.

HYPERTROPHY OF THE TONGUE, OTHERWISE KNOWN AS LINGUA VITULI, LINGUA PROPENDULE AND MACROGLOSSIA.

This affection of the tongue, though rare, is mentioned by nearly all surgeons of large experience. The case described by the speaker was that of a girl, 12 years of age, admitted to the Harrisburg Hospital January 6, 1886. The tongue protruded from the month a distance of three and five-eighths inches. The lips were greatly distended, and the angles of the mouth not far removed from the external opening of the auditory canal. The greatest width of the tongue was four and three-fourths inches, and the greatest circumference nine and three-fourths inches. The prolapse of the tongue was only of two months' duration, and had begun without apparent cause. The measurements taken one week after ad mission showed a decided increase in the size of the tongue. The tongue was removed on February 19. After providing against hæmorrhage the organ was removed with scalpel and scissors, the section being so made as to secure a conical stump. All the dense fibro mass was taken away, the weight of the removed; portion being over ten ounces. By January 31, the stump was entirely healed. There was no difficulty March 23, she could eat and drink without difficulty tongue.

DR. L. McLANE TIFFANY gave the history of a case. A negro girl, 5 years of age, had suffered with hypertrophy of the tongue dating from birth. Ever since the first few months of life, the child had for limited epithelioma of that part. been unable to cover the tongue with its lips. The tongue was removed with the Paquelin cautery. Within a week the patient was eating potatoes and meat, and left the hospital ten days after operation. At this time there was a healthy granulating surface.

Dr. J. Ford Thompson, of Washington, reported of old surgery when we do so.

TWO CASES OF VAGINAL HYSTERECTOMY.

Case 1.—Mrs. A. E., aged 45 years, white, was seen in April, 1885, suffering with malignant disease of the nterus. There was great destruction of the cervix, the ulceration extending above the internal

that in view of the satisfactory manner in which the os. On consultation, it was decided to avoid hysterwork of the present meeting had been prepared, it ectomy if possible, but to limit the operation to amsaw no reason for a change and did not recommend putation of the cervix with scraping, etc. During the appointment of a business committee. It rec- the operation the peritoneal cavity was opened. It with reference to the abrogation of Article 9 of the womb was separated from the bladder in front. A Constitution. The committee was in accord with ligature was then placed around each broad ligament the President, but as the article had been introduced and tied. The uterus was then split in two. Each at the express desire of the first President of the As- half was then brought down, the broad ligaments sociation, it was then recommended that it be tied above the temporary ligatures, and the uterus allowed to remain. The committee recommended removed. After thorough cleansing the vagina was the adoption of the suggestion that applications for tightly packed with iodoform ganze. At the end of the operation the patient was very weak, and notwithstanding all efforts died in the course of twentyfour hours.

Case 2.—Mrs. H. white, aged 55 years, came Dr. T. J. Dunott, of Harrisburg, read a paper on under observation with cancer of the cervix, in January, 1887. The posterior lip of the cervix was almost entirely destroyed, and the disease had encroached upon the posterior cul-de-sac. The cervical canal was involved at least as high as the internal os. The operation was performed February, 21, 1887, antiseptic precautions being adopted throughout. The dissection was begun at the posterior part, and carried around the cervix. A silk ligature was passed with a long curved needle through the lateral vaginal vault of either side and tied. The inclosed portion was then cut from the nterus. These ligatures presumably enclosed the uterine arteries and the lower part of the broad ligament. The uterns was then separated from the bladder in front, and a loop of silk was attached to the peritoneum. The posterior cul de-sac was treated in the same way. The uterus was then tilted through the opening, and the broad ligaments transfixed and tied. There was no loss of blood. The peritoneal flaps were then brought together with two catgut sutures and a drainage tube introduced into each angle of the The vagina was packed with iodoform gauze. The patient recovered without any unpleasant symptoms.

DR. T. F. PREWITT, of St. Louis, agreed with the in keeping the mouth closed. When heard from author that extirpation of the uterus is a justifiable operation. He was almost prepared to go further, and say that on the earliest appearance of epitheland was gaining flesh rapidly. The paper was con-cluded with an account of the various operations ioma of the cervix the whole organ should be extirwhich had been practiced for the removal of the pated. He believed that ultimately this will be the course adopted.

> Dr. E. H. Gregory said that it was one of the rules of old surgery to save every part possible, and he would no more think of removing the whole lip

> Dr. R. A. Kinloch said that in the uterus we have an organ suspended in the pelvis and easily isolated. Now if statistics show that by cutting far and wide without jeopardizing life too much, we can cut short the disease, we are carrying out the rules

Dr. T. G. RICHARDSON reported a case of

ANEURISM OF THE LEFT SUBCLAVIAN ARTERY FOR THE CURE OF WHICH THREE METHODS OF TREATMENT WERE EMPLOYED --- DEATH.

The patient, a healthy muscular Irish laborer,

of the left subclavian artery was diagnosed. The proceedings had been conducted. patient had suffered with syphilis and constitutional measures were first tried. Todide of potassium in of the President. fifteen or twenty grain doses, was given three times a day. At the end of a week no perceptible effect being observed it was discontinued. Direct pressure was next tried, an elastic band with a compress over the vessel was secured to a belt around the waist This was continued a month, and although it slightly retarded the growth of the swelling, it had had no decided result. The third method, the introduction of surgical pins was next resorted to, nineteen of these measuring an inch and a half in length, were passed through the anterior wall of the tumor at different places. The ancurism was still growing rapidly, and all the pins that could be reached were withdrawn. Some of them had disappeared on account of the swelling which had taken place. An attempt was then made to ligate the axillary artery. but in spite of the utmost care the lower portion of the aneurism was ruptured in the progress of the operation. The wound was at once packed with lint dipped in Monsel's solution. The hemorrhage out difficulty after a moderately long labor. She having been stopped, half a drachm of a 5 per cent. left her bed on the eleventh day, having had no fever solution of bichloride of iron was injected into the centre of the tumor. At the end of twenty-four hours no coagulation having taken place, a second injection of twice the strength was employed. The next morning there was a exhausting hæmorrhage, ending fatally in a few hours.

Dr. Richardson also reported a case of

FEMORAL ANEURISM CURED BY ELEVATION AND FLEX-ION OF THE LIMB.

The patient, an Italian, aged 55 years, was admitted to the hospital Dec. 11, 1886, with a large aneurism of the femoral artery four inches below the femoral arch. While the case was being studied the limb was flexed at a right angle at the hip and knee and suspended on a Smith's anterior splint. The next day the pulsation was greatly reduced and the patient was quite comfortable. The treatment was continued and at the end of the third day the tumor was solid. The limb was kept in this position for ten days or two weeks. The patient was discharged cured one week later. The speaker called attention to the fact that there was no direct pressure upon the tumor and that the result was due entirely to flexion and suspension of the limb.

Dr. James McCann, of Pittsburg, reported a case

SPLENECTOMY.

patient.

Operation Practiced and the Results Obtained in the rience gained in the first case the uterus was curetttreatment of Cleft of the hard and soft Palates, illus- ed and a considerable amount of deciding removed, trated by the record of Fifty Cases, by Dr. Ewing and a intra uterine douche given. Stated Meeting, Thursday, April 7, 1887. THE PRESIDENT, THOMAS M. DRYSDALE, M.D., IN THE CHAIR.

D. B. C. Hirst read a paper on

THE ETIOLOGY AND TREATMENT OF CASES OF SO-CALLED TATE INTECTION IN THE PUERPERAL

The title of this paper is, I fear, too pretentious: Its object is merely the brief relation of four cases of so called late infection in the puerperal state, all, I believe, due to the same cause, all yielding to the same treatment and conveying therefore a lesson of some little interest and value.

The first case was young primapara delivered withand having manifested no unusual symptom: Two days afterward her cervix was exposed to view by means of a bivalve speculum and a slight laceration was discovered, healing by granulation. The following morning, the fourteenth day after delivery, the patient was unwell, her temperature was 102, large doses of quinine were given, but the temperature rose to 103 where it remained with slight morning remission for two days: A more careful examination being made, it was discovered that the uterus was unusually large, that the os was patulous, that there was a toul smelling discharge and considerable abdominal tenderness. The history of the case with these symptoms pointed to the retention of membranes, possibly a portion of the placenta and their subsequent decomposition originated by the admission of air to the vagina and uterus by the use of the speculum. Acting on this diagnosis, the uterine cavity was lightly scraped out with a dull curette and a large quantity of decomposing decidua removed This was followed by an intra-uterine injection of bi-chloride of mercury through a Bozeman's double catheter. The woman's temperature at the time was 103°. The following morning it had sunk to 99°, and within 24 hours was normal, and so remained.

The second case was also a primapara: The labor was terminated by the forceps. Upon the eleventh day the woman, although perfectly well until that The paper was a case in which removal of the time, had a morning temperature of 101° rising in spleen had been practiced with recovery of the the evening to 102°. The uterus was found larger than it should have been. The os was patulous and A paper entitled The Study of the Methods of there was a fetil discharge. Profiting by the expewomb almost at once contracted and the discharge A vote of thanks was then extended to the Surgeon-ceased; but the patient had, unfortunately, an ex-

In the third case, also a primapara, after an instrumental labor and an apparently normal lying-in, the temperature rose on the twelfth day to 99.8° and on the following to 100, at the same time a fetid mucopurulent discharge made its appearance. In this case a very large quantity of decidual membrane was removed and the scraping was repeated on the following day, whereupon the temperature fell to normal and the discharge ceased.

The fourth case was a primapara, who on the sixth day, after an easy labor, had a temperature of 100° although previously there had been no fever; the uterus here was very large, the os quite patulous. but in this case there was not much discharge. The same treatment was employed that had proved successful in the other cases, with the result of reducing the temperature within twenty-four hours to normal, where it remained.

Now this experience is entirely too limited to enable one to come to a definite conclusion as to the cause of late infection in the puerperal state, but pedantic details of modern treatment of wounds are these cases suggested to my mind the possibility at not fully carried out in practice. Carbolic acid is least that the retentive and subsequent decomposi tion of shreds of membrane or fragments of placental ing undoubtedly are responsible, in many instances, with this condition may lead to septicæmia and chanical treatment of injuries and after resections pytemia. Other causes of fever late in the puerperal consists in the use of complicated and ingenious state are of course well known. Partially healed splints which, in the hands of their inventors, answer torn apart and the fresh wounds thus produced may and comfort to the patient. Almost every hospital give entrance to the germs of septicæmia. Exposure to an atmosphere impregnated with emanations from sewers or water closets from bad sanitation out its advantages and the indications for its use. may give rise to febrile diseases at any time during the puerperium as proved in the cases related by Dr. Playfair in a recent English journal. There is a possibility that the pyogenic micro-organisms which may carry on their work in the uterine cavity without very serious consequences to the patient, may in the tubes manufacture their product, pus, in such quantities that it cannot be drained off, thus producing an abscess that may possibly open into the peritoneal cavity. There is a still more remote possibility that a travels westward, when he compares its lecture-rooms pyo-salpinx may be developed late in the puerperium' by other pathogenic micro organisms, by those of gonoriheea, of tuberculosis, or even those of actinomycosis. Finally any of the febrile diseases that may attack a woman at any time may fasten themselves upon her during the lying in period, but, as I have already said, it seems to me that the most common cause of late infection in the puerperal state is the decomposition of retained membrane or fragments of placenta, and that therefore the curette and the intra utcrine douche might be employed as a routine treatment in all cases where there occurs late in the upon the scientific career of distinguished profespuerperium, fever associated with a large uterus, a sional men. Sir Joseph Lister of to day is only the patulous os and a foul smelling discharge. This shadow of Mr. Joseph Lister of 1876. The dresstreatment can do no harm but may effect much good, ings which I was shown only corroborate this state-My own experience in this direction is, however, limited, and upon this point I would like to have the opinion of the Society, whose experience collectively is used to distinguish it from gauze not rendered asepand individually must be greater than my own.

(To be continued.)

FOREIGN CORRESPONDENCE

LETTER FROM LONDON.1

Charing Cross Hospital—King's College Hospital -Sir Joseph Lister—The Spray—Sir James Paget— St. Bartholomew's Hospital—Ovariotomy—Antisepsis -Tarsotomy as it should not be done—Museum of the College of Surgeons—Professor Stewart.

Dear Dr. Fenger:—My hospital visits in London began with Charing Cross Hospital. This institution is centrally located and was built in 1837. It contains nearly 200 beds, and affords a fair opportunity for studying accidental surgery, as the majority of cases treated here are recent injuries. Bloxam, Bellamy and Barwell are the surgeons in attendance. Although the spray is still in use and antiseptic dressings are applied, I found many of the wounds suppurating; the best possible proof that the essential and used as an antiseptic. Frequent changes of dresswill be found to be the most frequent cause of fever for the numerous failures in securing primary union late in the puerperal state, and that if not interfered of wounds. As in most English hospitals, the mewounds of the cervix, vagina and perineum may be an admirable purpose in securing rest for the parts surgeon has immortalized himself by the invention of some kind of a splint, and never tires in pointing Every London hospital has its own medical school. The building for the school of this hospital is quite small, smaller than any of the college buildings in Chicago, and the material used for illustrating the lectures is entirely inadequate. The class which expects to become proficient in the healing art in this temple of Esculapius numbers about 200. For a foreigner to visit such a school in the proud city of London it must become evident that science indeed with those of the medical colleges in Chicago.

> With such reflections 1 left this hospital and turned my way towards King's College Hospital, where I was to meet the father of antiseptic surgery. I was full of anticipations of what I should see and learn at the feet of the man whose teachings had revolutionized the practice of surgery throughout the entire civilized world. How great my disappointment! A walk through the wards of Sir Joseph Lister soon convinced me that prosperity and honors, even if well deserved, only too often exert an injurious effect ment. The only thing that was new to me in the way of dressing wounds was the colored gauze, which tic. Great importance is placed upon the disappear-

DOMESTIC CORRESPONDENCE

ALBUMINURIA WITHOUT ALBUMIN.

Dear Sir:—I desire to present the following case in the use of that rebellious instrument that had all to the readers of THE JOURNAL, making no attempt ready caused so much trouble and anxiety—the chain to explain their apparently wondrous features. The saw. After another free use of this abominable in-tests and observations, as well as the records, were

Mrs. M., aged 51. American, mother of one child position. As this could not be accomplished, it was 20 years of age. She presents no special diathesis, decided that the tendo Achilles was at fault, and this but for several years has had a debilitated, and someoffending structure was handed over to the liberal what emaciated appearance resulting chiefly from use of the tenotome. Another forcible attempt to overwork and a disturbed climacteric. In May, 1886, straighten the foot converted the subcutaneous tract and during my absence from the city, Mrs. M., from into an open wound, and as all the resources had exposure to cold and damp, was attacked with chills been exhausted by this time, a typical Lister dress- and some febrile action, for which my friend, Dr. D. ing was applied. When Esmarch's constrictor was was called to prescribe. Upon my return, about two removed the dressings soon became saturated with weeks subsequent to her attack, I found her able to crimson blood, which called for more antiseptic ma- sit up, but presenting the typical pallor of countenterial and firmer compression. The surgeon, at this ance, with puffiness below the eyes characteristic of stage of proceedings, was covered with perspiration, albuminuria. Dizziness was also complained of, and and only revived after the patient was carried into loss of appetite, with emaciation. The pulse was small, the ward and out of sight. I am unable to say what feeble and rapid. The feet, ankles, and legs, nearly became of the case, but if foot and life were pre- to the knees, were tensely edematous, pitting upon served, it is safe to predict that another operation pressure, with the usual glistening of the distended

surface. Inquiry failed to prove any special variation in the color or quantity of the urine at any time since her attack. A specimen was obtained at my first visit, which upon standing threw down a turbid, THE PRINCIPLES AND PRACTICE OF OPERATIVE milky deposit of considerable quantity; color (above sediment) light straw, sp. gr. 1020, heat with and without nitric acid, and nitric acid alone, failed upon repeated trial, to show the presence in any quantity, of albumin.

The microscope more than compensated for this negative chemical testimony by producing sufficient evidence in support of the diagnosis of nephritis. The specimen was marked by the absence of crystals, the field crowded with fat globules and tube casts. The casts were mostly large and roughly fractured; and some contained red blood. Subsequently, up to this date, no less than fifteen careful tests for albumin have been made, and at intervals varying from one week to a month, in some of which I have been assisted by Dr. S. G. Wilson, of this city, the result being uniform in the failure to find albumin. As this report refers only to one, but the most important, characteristic of this condition, the details of treatment are omitted.

The remarkable fact, that we may have albuminuria without albuminous urine receives support in the experience of my friend Dr. Wilson, who has a patient with much anasarca, indeed, water logged, and whose urine, while loaded with tube casts, resists all attempts to display a trace of albumin, a fact seriously misleading, and actually defeating efforts to arrive at a satisfactory diagnosis or treatment until the tube casts disclosed the situation.

Very truly yours,

H. C. MARKHAM, M.D. Independence, Iowa, May, 1887.

MISSTATEMENTS OF THE MEDICAL RECORD.

Dear Sir:—One might be led to believe, after reading the following item in the New York Medical Record, of May 14, that the editor of that journal is the advisory angel of the American Medical Association:

"The coming meeting of the American Medical Association at Chicago will not, we trust, be 'hippodromed in the extraordinary and undignified way which characterized its session a year ago. It is not a question of codes, a climate or locality, but of selfrespect, the dignity and conservatism which ought to characterize a great representative body of physicians."

It would be well if the editor of the Record would attend the meetings of the Association, and learn from personal observation how that body conducts itself, instead of issuing his annual diatribe a thousand miles away, and thus making himself ridiculous by his gross misrepresentations of the conduct of the meetings of the Association and of the large number of physicians who make up that body,

Very truly yours,

J. F. JENKINS, M.D.

Tecumseh, Mich., May 25, 1887.

BOOK REVIEWS.

SURGERY. By STEPHEN SMITH, A.M., M.D., Professor of Clinical Surgery in the University of the City of New York, etc. New and thoroughly revised edition. Illustrated with 1005 woodcuts, 8vo., pp. xxxii—877. Philadelphia: Lea Brothers & Co. 1887. Chicago: A. C. McClurg & Co.

Since the publication of the germ of this work in 1879, there have been eight issues; but this book as it now appears is really the second, and only revised, edition. And one can form but little idea of the change made in the work without directly comparing the first issue with this last edition; the difference lies in the fact that the first edition was the exponent of the operative principles of the "old surgery," while this embodies the principles of the "new surgery."

The first chapter, on the "Civil Obligations of the Surgeon," may seem to be "matter out of place" in a work on operative surgery; but a moment's reflection will show that such is not the case, and it should be carefully read by every medical man. And certainly all must agree with him that "antisepsis imposes new obligations" upon the surgeon; in surgical cases he must apply antiseptic principles with reasonable care and diligence, or he may be justly held responsible for unfavorable results from conditions preventible by antisepsis.

It would be impossible to give an analysis of the book in the short space at our disposal; and, indeed, those familiar with surgical literature will not wish it. Dr. Smith's work does not need our commendation, and, except in a few particulars, it is beyond criticism. The treatment of stricture of the urethra is not mentioned, nor is the operation for shortening bones in extensive injuries to the soft

INTERNATIONAL CONGRESS.

SECTION IN PSYCHOLOGICAL MEDICINE AND NERVOUS DISEASES.

It is proposed to give one of the Sessions of the Section in Psychological Medicine and Nervous Diseases, during the meeting of the Medical Congress, to a discussion on Syphilis and its relations to Insanity.

The discussion will be opened by Dr. George H. Savage, Senior Physician Bethlem Royal Hospital, London, England, and will embrace the following divisions:

- 1. Iodicy, imbecility, moral perversions due to inherited Syphilis.
- 2. Insanity associated with acute Syphilis, (A) Physical, (B) Moral.
- 3. Syphilis producing Epilepsy, with or without Insanity.

4. Syphilis producing Mental Weakness, (A) with, (B) without Paralysis.

5. Syphilis as associated with general paralysis of the insane.

6. Pathology, as represented by coarse changes like gummata, or slighter ones as seen in Arterial

Several of our English confrères have already arranged to take part in the above.

Those who intend to engage in the discussion of one or more of the above "questions," should send notice to the Secretary. The time allowed for each paper in the discussion, is ten minutes. Tabular and bibliographical material can appear in the printed paper, but it is respectfully suggested that the matter prepared for reading be as illustrative and pointed as possible.

Clinical observations, post mortem appearances and conclusions will be specially applicable.

Papers relating to Syphilis and Nervous Diseases will also be read during the same session.

E. D. Ferguson, Sec'y.

Troy, New York.

ASSOCIATION ITEMS.

RAILWAY AND HOTEL RATES.

These rates have been fully published in THE JOURNAL for the past three weeks. The railways have agreed to return physicians attending the meeting, on presentation of a combined certificate and receipt, or simply a receipt from the railroad agent at starting-point, stating that full rate has been paid going to Chicago. Those who intend coming to the meeting should again read the letter of Dr. Montgomery in THE JOUR-NAL of May 21, page 5'6 before setting out.

Dr. Montgomery's instructions in brief are: He will furnish OFFICIAL persons starting from points in Trunk Line territory—which is East of Niagara Falls, Buffalo, Salamanea, Pittsburg, Bellaire and Wheeling, with blank forms, known as the "Trunk Line Certificate," upon application to him for same. Persons from the places just named and points West thereof, will be required to use the certificates of the Central Traffic Association, which will be furnished by the ticket agent at starting point when ticket is bought. One or the other of these forms of certificate should be obtained when the ticket is bought for Chicago, as persons living East and South must have their certificates endorsed by the Chairman of the Transportation Committee.

Southern Visitors.—Dr. Montgomery will supply delegates and members of their families, with the "Southern Passenger Association" blank certificate; and such delegates (Southern), will use this certificate upon any of the 42 lines of railway South of the Ohio and Potomac rivers. As regards those living along Trunk Lines or in the Southern Passenger Association territory, Dr. Montgomery's certificates will be honored within territory West of termini of the various trunk lines of roads, as the places named above indicate, as well as to North of the Ohio tiver—known as the "Central Traffic Association territory."

Tickets for return journey are to be sold in Chicago at onethird the Lowest Regular Limited Fare, to those coming from the East or South upon presentation of certificates properly endorsed at the meeting.

In all, there are some ten or twelve members, we believe, that constitute the Committee on Transportation here, whose earnest endeavor it will be, to permit no delay in assisting our professional brethren in the matter of their acquiring full and complete information upon the above topics, at time of arrival, during the stay with us, or before the hour of departure for the return journey. Therefore, we venture a safe prediction in saying, that all who come will be cordially welcomed by this Committee, as well as by the entire profession of this Garden City.

Telegrams for blank certificates will be immediately answered.

MISCELLANEOUS.

Milk as a Medium of Infection.—The spread of disease through the medium of milk has often been demonstrated, but seldom more strikingly than by an investigation lately pursued by the Massachusetts State Board of Health, for the purpose of discovering the cause of an outbreak of typhoid fever that occurred last autumn in a certain district in Cambridge. It was found that all the milk supplied to the district came from one farm in New Hampshire; that on the farm there was a well into which a privy vault drained, the water of the well being used to wash the milk cans; and, finally, that last summer a person lay sick with typhoid fever on the farm. The conclusion was unavoidable that the fever-germs were carried in the milk, and thus the disease disseminated among the people of Cambridge.—New York Medical Journal, March 10, 1887.

OFFICIAL LIST OF CHANGES IN THE STATIONS AND DUTIES OF OFFICERS SERVING IN THE MEDICAL DEPARTMENT, U. S. ARMY, FROM MAY 21, 1887, TO MAY 27, 1887.

Major V. B. Hubbard, Surgeon, granted leave of absence for one month, to take effect on or about June 1, 1887. S. O. 119, A. G. O., May 24, 1887. Capt. F. W. Elbrey, Asst. Surgeon, found incapacitated for

active service by an Army Retiring Board; sick leave still further extended until further orders, on account of disability. S. O. 116, A. G. O., May 20, 1887.

Capt. II. G. Burton, Asst. Surgeon, granted two months' leave of absence, on surgeon's certificate of disability. S. O. 107, Div. Atlantic, May 25, 1887.

FICIAL LIST OF CHANGES IN THE MEDICAL CORPS OF THE U.S. NAVY, DURING THE WEEK ENDING MAY 28, 1887.

Deane, C. W., P. A. Surgeon, detached from "Dale," and to hospital, Mare Island.

Harvey, H. P., Surgeon, orders to "Iroquois," revoked, and wait orders.

Dickson, S. H., P. A. Surgeon, detached from Navy Vard, Washington, D. C., and to the "Dale."

Waggener, J. R., Surgeon, detached from the "Iroquois," and wait orders.

White, S. Stuart, Asst. Surgeon, ordered to receiving ship "St. Louis," Navy Yard, League Island.

Field, James G., M.D., of Gordonsville, Va., commissioned Asst. Surgeon in the Navy, May 23, 1887.

OFFICIAL LIST OF CHANGES OF STATIONS AND DUTIES OF MEDICAL OFFICERS OF THE U.S. MARINE HOSPITAL SERVICE FOR THE WEEK ENDED MAY 21, 1887.

Goldsborough. C. B., Surgeon, leave of absence extended to June 1, on account of sickness. May 18, 1887.

Guitéras, John. P. A. Surgeon, granted leave of absence for

four days. May 21, 1887. Armstrong, S. T., P. A. Surgeon, to remain in charge of Service at Memphis, Tenn., until further orders. May 21, 18-7. Bevan, S. C., P. A. Surgeon, leave of absence extended thirty

days. May 19, 1887.
Carrington, P. M., Asst. Surgeon, ordered to U. S. Revenue Str. "Rush." May 18, 1857.

Norman, Seaton, Asst. Surgeon, to proceed to Marine Hospi-

tal, Baltimore, Md., for temporary duty. May 20, 1887. eath, F. C., Asst. Surgeon, granted leave of absence for Heath, F. C., Asst. Surge thirty days. May 18, 1887.

Woodward, R. M., Asst. Surgeon, appointed an Asst. Surgeon May 20, 1887. Assigned to temporary duty at the Marine Hospital, Balttmore, Md. May 21, 1887.

PRESIDENT'S

CELL ANTAGONISM.

Delivered before the Thirty-Eighth Annual Meeting of the American Medical Association, June 7, 1887.

BY ELISHA IL GRIGORY, M.D.,

OF ST. LOUIS, MO.

mentous questions.

apeutics, this "vis mediatrix natura" will be always in solid phalanx to confront noxious agencies, and the the indispensable auxiliary of the physician, without combat is hotly contested till victory or discomfiture. which ally abandonment of the art would be inevitable. Inflammation, the keystone of medical science, the

the fixed cells, cells which occupy the fortifications theory of cell antagonism; it is practically a struggle within the inter-cellular substance; the other class between irritant bodies and white blood-corpuscles.

ADDRESS. provides for the formation of new tissue, and represents the standing army, sometimes called embryonal substance. Before Cohnheim, our knowledge of the mobile elements—the mobilized army—of the body, was nothing; now most of the literature relating to neoplasm is or has become obsolete. Now coagulable lymph is impossible without the white corpuscles. Organizable fluids have vanished. Through the ingenuity and industry of the great German pa-Obviously, force and matter "make up" the uni-thologist a revolution has been worked in medical verse. Force implies antagonism, antagonism per-thought. The study of the mobile elements of the petuates motion. The living cell is the embodiment body—the relatively independent elements—promof nature. Cell antagonism is life. Multicellular ises much. We can almost see daybreak in patholorganisms represent a community of vital unities, ogy, a dawn before the coming light which is to A model organism in equilibrium is health. Cell illuminate some of the dark places of this most instruggle is the gist of modern pathology. Every tricate subject. Already leucocytes substitute fibrin. organ and every element are vulnerable. The The latter is the product of the former. Wherever strength of resistance in elements and organs, rein-there is localized impairment of nutrition referable forced by the harmony and precision of coordina to irritation, or defective maintenance of nutrition, tion, and the vigor of counter agencies, are the mother result of inherent weakness, there the leucocytes concentrate, feast on the devitalized structures, and In seeking for a comprehensive title for my address, I fell upon the two simple words "cell antagonism," which form the foundation of symptom atology and pathology, conjoined with cell changes, the basis of pathological anatomy, embracing at once the basis of pathological anatomy at the basis of pathological anatomy at the pathological anatomy at the basis of pathological anatomy at the pathological anatomy at the basis of pathological anatomy at the pathological anatomy the universe of life and all the possibilities of life; expects the leucocytes to congregate and destroy the disease being but one of multitudinous phases of life. cyst, substituting a granulation tissue, which in time lluxley has likened the body to an army. "Of becomes scar tissue. Now an organizable fluid as this army, each cell is a soldier; an organ, a brigade; the essential product of inflammation, cells playing the central nervous system, headquarters and field a passive part, is a thing of the past. Now cell telegraph; the alimentary and circulatory system, potency, cell subtlety, and cell antagonism constitute the comissariat. Losses are made good by recruits the pith and marrow of medical science. There was born in the camp, and the life of the individual is a a period in the history of pathology when all the neocampaign, conducted successfully for a number of plasia sprang from the tissue cells; now the place and years, but with certain defeat in the long run." A destiny of the cell tissue is fixed. When the tissue elemodel organism assumes that every soldier is a stall ments yet contain some undifferentiated protoplasm, wart; every organ, a body of stalwarts with correspondiferation is possible, otherwise not probable. The ponding machinery of coordination and precision, mobile cells constitute the mobilized army; the great all alike concerted and vigorous to meet the myri-coordinating centres assemble them at any moment, ads of counter forces, many of which are too cunning ready to antagonize hurtful agencies. Irritation alfor our ken, but ever ready to take advantage of the ways provokes a concentration of the white cells. least failure of our strength, to penetrate our vitals. Irritation means injury. It may be simple or spe-This force of vital resistance forms the basis of ther- cific. Either way it is a signal for moving the army

The morphologist distinguishes two classes of ele-standard process by which all other pathological conments within the organism. One class represents ditions are measured, is only to be explained on the

Foreign bodies are invariably invaded by leucocytes, number and augmenting their strength, correspondtheir swarming having for its object to repel or ren- ing to the emergency. A recent authority, Mr. der inert the offending cause. Observations directed Sutton says: "If we summarize the story of inflamto the white cell have been followed by an inspiring mation as we read it zoologically, it should be likincrease in our knowledge of the vital properties of ened to a battle. The leucocytes are the defending cells in general. The quality of spontaneous motion army; their roads and lines of communication, the once accepted, the idea that the cell played a passive blood vessels. Every composite organism mainpart quickly disappeared, and in its stead came the tains a certain proportion of leucocytes as representconception of autonomy, the fact that the cell nour-ling its standing army. When the body is invaded ished itself, is not nourished, that the cell specialized by bacilli, bacteria, micrococci, chemical or other food for its own purposes, actually breaking up com-litritants, information of the aggression is telegraphed pounds and adapting the products to its own growth by means of the vaso motor nerves, and the leucoand development; strikingly illustrated by an inde-cytes rush to the attack, reinforcements and recruits pendent form of government, for example, the govarre quickly found to increase the standing army, ernment of the United States. A great statesman sometimes twenty, thirty or forty times the normal has said ours was a "government of the people, by standard. In the conflict cells die and often are the people and for the people." Cells live of themeaten by their companions; frequently the slaughter selves, by themselves and for the whole body. The is so great the tissues become burdened by the dead cells make the central government. The coordinating machinery is formed by the cells, and the cells of the cells being testified by the fact, that the are in their turn centralized and harmonized by this power. The tissue elements are in direct continuity with the centre, but it is otherwise with the floating, wandering cells; yet their behavior gives evidence of hurtful to the organism they in their lifetime were their concern for the well being of the entire organism. Again, the free cells take into their substance the most refractory substances, digesting solid bodies; sponges and green plants yielding to their digestive and assimilative processes. Observations the most patient and trustworthy on the lower vegetables have demonstrated the fact that bacteria have been seen in the substance of amœboid cells; others have been seen pursuing bacteria, ultimately capturing and destroying them. Throughout the whole animal kingdom mesoderm cells use their ingestive power for destroying micro-organisms. Further, this property seems to be utilized for the removal of larval organs. Colorless corpuscles present the same appearances and have similar properties and the same mode of origin in the entire range of living beings. When germs. The nutrient changes come into vigorous the irritant or harmful agency is particularly obdu rate, white cells exhibit a very strange habit of throwing out processes which unite with similar processes from neighboring cells, until a considerable mass of jury. The addition of new material is invisible in protoplasm is formed by their confluence, constituting a giant cell. Thus an army of giants may be ample, the substitution being atomic. When a improvised on occasions of extreme emergency; for example, when the tail and gills of the tadpole are to be swept off, this powerful division is ready for the Herculean task.

Apply these facts to the inflammatory process in mammals. Suppose a foreign body lodged, that moment leucocytes leave the blood-vessels and congregate for the purpose of opposing the intruder. In such diseases as tubercle, leprosy, etc., the giant cells appear, and in their centre—their substance the specific bacillus is found. Koch found the bacillus anthracis and the bacillus of septicæmia in the mouse, enclosed by white blood cells. We say, with these observations before us, inflammation excess of normal physiology; simply the free cells, the parts, involving bone, joints, the great cavities, etc.,

bodies of the soldiers in the form of pus, the activity protoplasm often contains bacilli, etc., in various stages of destruction. The dead cells, like the corpses of soldiers that fall in battle, later become anxious to protect from harm, for they are fertile sources of septicæmia and pyæmia, the pestilence and scourge so much dreaded by operative surgeons. The analogy may seem to some a little romantic, but it appears to be warranted by the facts."

Just here the question obtrudes, are the action which follows mechanical, chemical and thermal in juries, and the action caused by vital injuries alike inflammatory processes? In the one, that resulting from physical causes, the nutrient processes are not disturbed, simply increased. In the other, that resulting from vital causes, the cell processes are disturbed, thwarted and vitiated. It seems unfortunate that the action which succeeds to traumatism should be confounded with that which succeeds to specific play after an ordinary injury, altered in one particular only, viz: the presence of a palpable neoplasm, which substitutes the structures doomed by the inordinary nutrition, growth and maintenance for exstructure is destroyed bodily, as in traumatism, the substitution is corpuscular, therefore palpable. It is certainly perplexing to assume, as does Sir James Paget, that a visible neoplasm is produced by inflammation, but its development is impossible till after the withdrawal of the inflammation. To get rid of confusion, though we do not emerge from error, is to make a step towards truth. The full effect of traumatism is immediate and complete: it cannot increase itself, therefore its effects are always limited and within the possibility of estimation, for the reason that cause and effect are in precise correspondence; besides antiseptics do not influence the changes in any particular. On the other hand, hibits a new aspect; cells conquering cells as a pro- the most extensive and severe injuries of vascular white cells resisting injury, there being a provision are possible without producing inflammation, provided not only for concentration, but for increasing their antiseptic precautions be taken. When such complication ensues, it is a wound accident, not a wound touched. Pasteur's cell mechanisms exceed the

SATURDAY, JUNE 11, 1887.

THE MEETING IN CHICAGO.

At one time it was thought that in view of the early meeting of the International Medical Congress there would be a comparatively small attendance at this thirty-eighth annual meeting. These fears, however, are now shown, as we go to press, to be ground-As early as Monday evening about two hundred delegates and members were registered, and it is now probable that the attendance will not fall short of fifteen hundred. The programme of the Sections shows that the number of papers and addresses is greater than ever before, being almost double the number last year. So far as can be seen at present all portions of the country are well represented except the extreme West. It will be seen that the President's Address, on "Cell Antagonism," is out of the usual line of such addresses. As a paper on the subject of which it treats it may be said to be complete, and no one can read it without instruction. The Association is to be congratulated that its Sectional work has been still further divided by the creation of a Section on Dermatology and Syphilography.

STRUATION AND AMENORRHŒA.

We take pleasure in announcing that rian affections, there are many cases of amenorrhea, Dr. von Klein has received subscriptions for about or very scanty menstruation, in which the chief fault five hundred copies. We make this announcement

seems to be with the uterus. Practitioners know that many of these cases are attended with very distressing symptoms, and that relief is urgently required. The administration of emmenagogues and other drugs in such cases is usually attended by but little success; and that the means at our disposal for treating such cases are very inefficient is shown by the number of drugs and measures recommended.

Many years ago Dr. James Braithwaite, of Leeds, after reflecting upon the hæmorrhage caused by uterine polypi, introduced small foreign bodies into the uterine cavity, and left them, when he wished to bring on menstruation or increase its amount. Hot baths, iron, aloetic aperients, and alteration in the diet and habit of the patients, were used at the same time. The most convenient foreign body he found to be a small piece of hempen ligature, doubled several times, knotted, and impregnated with pitch. These were carried up to the fundus and left there. Some success was obtained, but they were generally expelled by the uterus before they had done their work. They were therefore abandoned for a Greenhalgh's rubber stem. This he has found very efficient in a considerable number of cases. The stem is earefully washed in carbolized water, introduced into the uterus a week before menstruation is due, or supposed to be due, and left in position. A harmorrhage will usually result in a few days; but whether it comes on or not the stem should be left in position. While Dr. Braithwaite has had many successes with this method, he has also met with failures. But the method, in his opinion, is the best and most certain means of bringing on absent menstruation, or for increasing a scanty flow. Wynn Williams' stem may also be used, and it has the advantage that it is not easily expelled from the uterus. Dr. Braithwaite has also made what he calls an artificial polypus, to remain in utero.

Dr. Braithwaite reports two interesting successful eases treated by the stem, the record of which may be found in the British Medical Journal, of April 30. This method is briefly referred to by a few writers, but it is probably unknown to the majority of the profession.

THE MEDICINE OF THE TALMUD.

The works of Hippocrates, which are generally thought to be the beginning of medical history, were written favorable cases, the swelling and false membrane only three hundred years before Christ. This book will, therefore, add three hundred years to the annals of medical science, if nothing more. While it is true there are within it many "childish and irreverent things" relating to medicine, nevertheless to recovery were the only ones in which the author had those who carry not creed prejudice it will give more than history. The hygienic portion will be of benefit to sanitary science. The laws regulating separation of women during their menstrual period will be a revelation to the greater part of the profession, and the medical jurisprudence will add much to modern medicine. Besides the medicine and its collateral branches contained in the Jerusalem and Babylonian, Talmuds with all their Tosephtos and Siphri Medrashim, much will be embodied from the Rambam (Maimonidis) Yorah-Deah, Shulchan Aruch, Aien-Jacob, Eben Ha-Ezeir, and from many other works of equal antiquity. Probably not less than three years of severe labor will be required to make the researches and translation; and we therefore appeal to literary men of the profession to subscribe, in order that the work may not be unnecessarily delayed.

SOCIETY PROCEEDINGS.

AMERICAN LARYNGOLOGICAL ASSOCIATION.

Ninth Annual Meeting, held in the Hall of the Academy of Medicine, New York, May 26, 27 and 28, 1887.

THURSDAY, MAY 26-FIRST DAY.

MORNING SESSION.

THE PRESIDENT, E. FLETCHER INGALS, M.D., of Chicago, called the Association to order, and read THE PRESIDENT'S ADDRESS.

the most useful operations of modern times. In the weight of the instrument and the formation of the after-treatment, while the tube is in position, no head. liquids should be allowed. Sometimes small quan-

should be entirely prohibited. The largest tube that can be introduced is the one most likely to be retained. The danger of the tube being forced into the trachea was referred to. In four or six days, in will have so much diminished that the tube will be coughed up finally and need not be withdrawn.

The speaker had performed intubation in twelve cases of diphtheritic laryngitis. In three cases recovery followed. By a coincidence, the cases of charge of the after-treatment. One case lived eight days and then died suddenly an hour after the tube had been removed. Another lived eight days and then died of pneumonia. Details of the cases treated were given. As a result of his experience, he concludes that the treatment after intubation should be: 1. Prohibition of fluids except by enemata. 2. Some preparation of mercury should be given in large and frequent doses. 3. In case of development of bronchitis or pneumonia, respiratory and cardiac stimulants should be given freely but cautiously.

By correspondence and study of the literature he had collected 514 cases with 134 recoveries. The percentage of recoveries will be greater when more care is exercised in the use of fluids. When medicines fail, no time should be lost in providing for the free entrance of air, either by intubation or tracheotomy. Intubation can be done more quickly, more safely, with less shock to the patient and less objection on the part of the parents. The operator should be prepared to open the trachea if loosened membrane should be forced down into the trachea. When the tube fails to relieve the dyspnæa tracheotomy should be performed, unless there is reason to believe that the latter operation will fail. When membrane is loose in the trachea, no time should be lost in the use of the forceps, which rarely succeed, but tracheotomy should be resorted to. The results obtained by intubation are about as good as tracheotomy at all ages, but apparently better in young children.

Dr. Charles E. Sajous, of Philadelphia, read a STUDY OF SOME OF THE OBJECTIONABLE FEATURES OF INTUBATION.

The principal objections to intubation, according to the degree of danger, are: 1. The tendency to the obstruction of the tube by fragments of membrane. 2. Crowding down of loose membrane during introduction of the tube. 3. Passage of food In referring to Intubation of the Larynx, the his- into the trachea. 4. Momentary arrest of respiratory of the operation and a description of the in- tion during introduction of tube. 5. Liability of the struments used in the operation were given. The tube to be coughed out; and 6, slipping of tube into method of operation was then referred to. In 1858 the trachea. The tendency to obstruction was atan attempt was made in Paris to treat stenosis tributed to the limited diameter of the tube; the by intubation. Seven cases were operated on, and crowding down of membrane to the length of the of these five died, and two cases recovered after tube; the passage of fluid to the weight of the tube; subsequent tracheotomy. In 1880 O'Dwyer introduced intubation, and gave to the profession one of eter of the tube; and the slipping of the tube to the

In one case, the attempt to introduce the tube caused spasm, and tracheotomy was performed. In every case there was immediate relief of dyspncea. In three cases apparatus for compressing air. the tube was coughed up and swallowed.

that feeding with a tube introduced into the cesophagus would overcome the difficulty. This plan can

also be used in cases of tracheotomy.

Dr. Morris J. Asch, of New York, remarked that there are a few objections which should be brought to the notice of the profession. One of these is that membrane may be crowded down which is very difficult to remove, even by tracheotomy. Another objection is the difficulty experienced by the ordinary practitioner in the removal of the tube.

Dr. B. F. Westerook, of Brooklyn, did not think that the weight of the tube is what causes the trouble in deglutition, for the muscles which elevate the larynx are quite strong. It seemed more likely that the difficulty was due to the rigid tube, which holds the larynx open. In normal deglutition the entrance of

the larvnx is closed.

DR. D. H. CHAPMAN, of New Haven, said that the most distressing symptom after the introduction of the tube seems to be thirst. It would be interesting to study the cause of this. Could it not be relieved by the use of enemata and by baths. may be occasioned by the use of the mercury, which might be introduced in some other way than by the mouth. The use of pilocarpin, which, even in small doses, causes salivation, might be of service.

THE PRESIDENT said that it is so rare that the tube becomes elogged that it is not necessary to have a skilled attendant. When the tube becomes clogged it is usually coughed up, and, as a rule, it is not necessary to replace it for two or three hours. The attempt to feed these patients through a tube introduced treated forty two cases. A study of these cases into the resophagus has been tried in Chicago, but he tended to confirm the opinions expressed in Februhad not heard any stress laid on this measure.

The following were appointed as the Nominating Committee: Drs. Beverly Robinson, of New York, W. C. Glasgow, of St. Louis, and S. H. Chapman, of New Haven.

AFTERNOON SESSION.

Dr. John B. Mackenzie, of Baltimore, read a paper entitled

THE PATHOLOGICAL NASAL REFLEX-AN HISTORICAL STUDY.

The fact is established beyond doubt that a causal relation exists between diseases of the nasal mucous membrane and other portions of the respiratory tract and many conditions of distant parts of the body. Hay fever can be traced to the time of Galen. The fact that tickling of the nose would arrest hiecough is referred to by Plato. The irritating effects of the odor of flowers were recognized in very early times. Reference was made to the observations of various individuals in regard to reflex conditions due to nasal disease. During the eighteenth century much was written upon this subject.

Dr. John O. Roe, of Rochester, read a paper on

HAY FEVER. ANALYSIS OF CASES, WITH RESULT OF TREATMENT.

Up to the last hay fever season, the author had ary, 1883. Some of these views have been modified. Dr. J. Solis Cohen, of Philadelphia, gave a de- Of the forty-two cases, twenty-six were males and sixteen females. The attacks came on between May 1 and August 1. become independent centres of irritation.

areas in the nose.

7. The affection is not per se neurotic, nor is the so-called neurotic condition of the person necessary to render a person susceptible to local irritation applied to the air passages. It is not necessarily associated with the nervous temperament.

8. The neurotic condition which is often regarded. as the cause of the hay fever, is often the result of the local irritation.

 By careful and thorough treatment of the disease of the nasal tissue, combined with that of other portions of the respiratory passages below, which have become secondary sources of irritation, we need not fail to cure hay fever.

Dr. C. E. Sajous stated that at the last meeting

DR. J. N. MACKENZIE regarded hay fever as a neurosis. That it is a disease of the nose producing re-

the turbinated bones. In the majority of cases the arises whether this is primary or secondary, or whether septum was as sensitive as the turbinated bones. it is only an accidental condition. There is, I think, Thirty-one patients suffered with asthma. But twelve always some more central cause than the affection of patients had a distinctly nervous temperament, while the nose. Where the disease is recent, it may possibly be arrested by local treatment, but where the The plan of treatment adopted is to restore the affection is of long standing, he did not believe that nasal passages to as near as possible a normal con-simple local treatment of the nose would overcome dition, and destroy the sensitive areas. The disease in the nose may produce disease in diet, and restricting the use of meat. The more we other portions of the respiratory tract, which may look upon this as a constitutional affection and the less as a local condition the sooner will we get at the 6. The affection recognized as hay fever is due to truth. A large number of these sufferers have oblocal irritatives brought in contact with the sensitive struction in the nasal cavities, but many have no such obstruction.

> Dr. J. O. Roe considered hay fever as the reflection of some irritation from the nasal chambers, which irritation is produced by some foreign substance coming in contact with the mucous membrane of the nose. Irritation reflected from other situations to the nasal chambers is not hay fever. He thought that Dr. Mackenzie includes some such cases. He had never seen any evidence to show that this was a neurosis.

Dr. D. Bryson Delavan read a paper on

THE TREATMENT OF ATROPHIC RHINITIS BY APPLICA-TIONS OF THE GALVANIC CURRENT.

Some years ago Dr. E. L. Shurley, of Detroit, reche had reported some cases in which the use of the ommended the use of the galvanic current in the cautery had been only of temporary benefit. H.EMOPHILIA.

H., a clergyman, tet. 52, entered the hospital, July 12, 1886, for tonsillar abscess, of which he had had several previous attacks. The first was treated by incision, which was followed by hemorrhage that did not finally cease until six weeks had elapsed. In a day or two after entrance the abscess broke, and the day after this he began to pass bloody and smoky urine, the source of which the microscope showed to be the kidneys. He reported that hæmaturia had followed each previous attack of parenchymatous tonsillitis, and was also brought on by unusual mental excitement or exertion. In all, he thought he had had as many as 150 attacks. If he kept quiet, and drank large quantities of water, the bleeding generally ceased in five or six days, but if he worked it lasted from twenty to thirty. When a child, slight knocks produced large, black-and-blue, painful swellings, which were slow to subside. When 21 years of age he had an epistaxis which threatened life, but bleeding from this source has never recurred. The tendency to bleed has, he thinks, diminished as he has grown older, but slight cuts are still followed by free and persistent hæmorrhage. No history of hæmophilia in either parent or grandparent could be obtained; all were long lived. Of his seven brothers and sisters, one brother shows this tendency, and a sister's son exhibited the hæmorrhagic diathesis to a marked degree, finally dying of persistent hæmaturia.

Hæmophilia, like color-blindness and pseudohypertrophic paralysis, is transmitted through the females of a family, the females themselves generally The tendency can thus oftentimes be followed through many generations. My patient is an unusually intelligent man, and the fact that he can not trace the diathesis behind his own generation is one reason for reporting the case.

A CASE OF TETANY(?).

A stable-boy, 19 years of age, of good family and hysteria, and tetany. previous personal history, entered the hospital September 30, 1886. He was muscular, well built, and of tetanus is the stiffness of the jaw, but this had ruddy. He said that for the past year there had been present for a year; this fact, with the absence been slight, but constant, stiffness of the jaw, which of rigidity of the neck and back muscles, and the had not hindered speech or mastication, but had transitory character of the attacks, with entire free-been sufficient to give him a constant desire of mov- dom from symptoms in the interval, warrant us in ing the jaw from side to side, and this had now be-excluding tetanus. Hysteria is not so easily, and I come a habit. The day before entrance, without do not feel that it can be positively excluded, especiany assignable cause or any warning, the stiffness ally as Dr. Weir Mitchell to whom I very briefly of the jaw increased very much, the hands and stated the case, thought it probably of that nature. forearms became numb and rigid; also the legs, to a But, apart from the attacks, there was nothing whatless degree. This was soon followed by general ever about the boy to suggest hysteria. He dreaded tremor. The whole attack lasted some ten minutes. the attack, as indeed, do hysterical women often-During the attack he had a dull feeling in the back times, for that matter. During the attacks he was of his head, whence the numbness and stiffness perfectly reasonable, and he was glad to be disseemed to start. There was no loss of conscious-charged from the hospital. In the diagnosis of hysness or disturbance of vision. He had three such teria, the impression which the individual makes attacks yesterday, and two to-day. In the intervals upon the observer counts for something, and this between the attacks he felt perfectly well. On en- impression was, in the case before us, opposed to trance, the patient was in the midst of an attack, and such a diagnosis. Moreover, the diagnosis tetany, was reported as having a chill. The temperature in a mild form, explains very well the symptoms.

was as follows: He was much excited, free from pain, but complained of a disagreeable, indescribable. sensation over the whole body. The pulse was rapid and strong, the breathing quickened. The expression of the face was peculiar, suggesting the visus sardonicus. The masseter muscles were hard to the touch; speech was difficult; there was marked stiffness of the arms and hands, the fingers being semiflexed. Efforts to strengthen the fingers encountered resistance, and caused slight pain. The legs were also somewhat rigid.

October 1. I saw him for the first time. During the night he had had an abortive attack. Examination of the internal organs gave entirely negative results. As I finished testing the reflexes, which were not remarkable, an attack came on, preceded, for a few moments, by discomfort slight mental excitement, and forced respiration. Stiffness then came on in the hands, arms, and fingers, which were all semiflexed: the thumbs were held firmly between the first two fingers. The spasm was tonic, with slight tremor at times, and forcible attempts to counteract it caused pain. The mind was perfectly clear, and the patient was positive that he had no real pain, though decided discomfort was caused by the rigidity of the muscles. After fifteen or twenty minutes the stiffness disappeared entirely. Whether this result was furthered in any way by the inhalation of a little ether, I cannot say. He was put on a full dose of bromide and chloral, every three hours, for several days. Slept nearly all the time, and had no more attacks, either spontaneously, on testing the reflexes and the electrical reactions, or during pressure on the brachial artery and nerve. There was no increased electrical reaction of the muscles, the current being passed through the nerve.

October 9. The patient was discharged, apparently well in every respect, except that slight stiffness in the jaw persisted. The diagnosis seemed to involve the consideration of only three affections: tetanus,

The feature of the case, which is chiefly suggestive

Tetany is a disease which is so rare with us—I can find no mention of it in Pepper's "System of Medi- it remarkable that the now well-known spontaneous cine"—that I may be pardoned for the following kemorrhage of new-born children (umbilical hamorbrief description of it: First described by Dr. Dance, rhage), which is to all intents and purposes the same who called it "intermittent tetanus," the term "tetany" disease, although fatal in eighty-four per cent. of the was first applied to it by Corvisart, and later adopted cases, yet in the few cases which recover does not by Trousseau, who also called attention to its com- recur, the hamorrhagic tendency being as it were, parative frequency in nursing women. It is me at that time as a case of tetany. The only case somewhat ill defined prodromata, and recur at varia- more than a year old. In adults I have never seen it. ble intervals during periods of a few days to months. I have seen a large number of nervous diseases at the brought on at will by pressure on the nervous and kind. arterial trunks, the spasm ceasing as soon as the stress.

Dr. Minor said that Dr. Shattuck's case corresponds closely with the description of the disease in a may be justified in citing a case which resembles some paper read by Dr. Lyman, of Chicago, at the annual of those spoken of to night. The patient was a neumeeting of the Association of American Physicians, rotic, poorly nourished boy of fourteen, who had been in June last, and printed in the Transactions of the at some charitable school, where his food and hygienic time by Dr. Carpenter, of Pottsville, Penn. I should ing to his story, he was not very well treated. A say that the disease is not extremely rare in children week before he came to the City Hospital, he held his under four or five years of age. We see the thumbs breath for some time in order to avoid a disagreeable bent toward the palm of the hand, the other fingers smell, and after this he began to have cramps, numb partially flexed, and the toes strongly flexed. There spells, and "pins and needles" sensation in his hands is usually some swelling of the hands and feet. These and feet. The cramps affected the whole body, and children are always feeble, insufficiently nourished, the pain was so severe as to make him cry out. These and often bottle fed, perhaps undergoing the process came on quite frequently. During the cramps he found of dentition. In one case, that of a child, three it difficult to speak or move. They lasted from half a months old, under my care, which was artificially fed, minute to a minute. He had occasional sick headimmediate improvement took place when a wet- aches and was rather costive. He was not strong, nurse was procured for the patient, who is now fifteen and was rather deficient mentally, and, as I said, was years old, and in good health. I have never seen a poorly-nourished, and rather emaciated. While in case in an adult which I recognized at the time, but the out-patient room he had an attack which I was possibly that of a physician who consulted me, and able to observe. He seemed nervous and agitated as also Dr. J. Putnam, might come under this cate- it came on. He said that the attack began in his feet gory. The movements were very striking, and cor- and went up, the muscles of his abdomen being most responded to those in one of Dr. Lyman's cases, affected. He stood up, his limbs were rigid, his arms which were communicated to him by another were by his side with the fingers much extended and physician.

With regard to the subject of hæmophilia, I think

DR. PUTNAM: I will merely speak of the case bilateral. The attacks are generally preceded by that I have seen occurred in an under fed child of not In the intervals between attacks, patients appear hospital, probably five hundred a year for a number well. Trousseau first showed that attacks may be of years, and I have never seen a single case of this

Dr. Webber: I remember two cases of tetany; I pressure is relieved. Erb has shown that the muscles was asked to see a patient several years ago, the musare stimulated with undue ease by means of electicles of the legs and trunks were affected, the arms less trical currents through the peripheral nerves. As so. When the attack came on the patient suffered long as these two phenomena are present, there is a very severely from a strong muscular contraction liability to the recurrence of the attacks. Attempts which could not be overcome by manual force. Ether to elicit the phenomena in my case failed, but the had been used to some extent for relief. The drug patient was already under the influence of chloral which gave the most relief was fluid extract of conium, and bromide when the attempts were made—a fact lafter some doses had been taken at intervals of two which may or may not be of importance. The affect hours, the attacks ceased; the man got well. He had tion nearly always passes off without leaving any had the affection for a number of days before I saw trace behind it. After carefully considering all the him. The other was a case in which the arms were facts in my case, I repeat that I am inclined to con-chiefly affected, the trunk was not affected. The sider it as one of tetany of a fairly mild form, and spasms had continued for several weeks, several atvery short course—three days. At the same time, I tacks each day, but nothing I could do gave him any am far from wishing to suppress the points opposed relief. I tried conium, electricity, etc. The attacks to this diagnosis, namely, the trismus of a year's dur- were quite painful. The man came to see me several ation, and the failure to bring out the signs of Trous-times but obtaining no relief, became discouraged seau and Erb, on which the books lay considerable and I saw no more of him. The attacks were very similar to those described by Dr. Shattuck.

Dr. Knapp: Tetany is so rare an affection that I Association. Other cases were reported at the same surroundings were not of the best, and where, accord-

somewhat abducted, his face was drawn with an ex- about eight or ten years old. He has never had pression of pain-whether from spasm or voluntarily any disposition to bleed. These cases are almost from pain, I could not say,—he made no movement, always hereditary. The remarkable point was that except a slight general tremor, and he made no answer when the patient recovered, she recovered comto my questions, because he could not move his lips pletely and permanently and never had another attack. and tongue he told me afterwards. He understood. Dr. Blodgert had had an opportunity of learning perfectly what was said during the spasm. Motion the history of one case similar to that reported by relieved the spasm. After recovery from the spasm I Dr. Shattuck, of a certain family of which I have conexamined him, finding nothing abnormal in the chest. siderable knowledge. This patient, a male, was one Pressure was made over the median nerve and brachial of several children of the same father and same artery, and soon after a second spasm came on. Furmother. On several occasions he bled alarmso I am disposed to regard this as merely a coin- ingly from the nose, the surface was blanched, he cidence. I then examined him with electricity. The became unconscious, and was evidently in the last muscles and nerves of the arms responded to a very extremity. He has not had other forms of hiemormild faradic current. With the galvanic current rhage, and the nose-bleed was the only accident he KaSZ=AnSZ with $\frac{2}{10}$ to $\frac{3}{10}$ Ma. in the various mus—dreaded and from which he expected to lose his life. cles of the arm. The median nerve responded to $\frac{1}{10}$. He is now lifty or sixty years old. Certainly the Ma. The boy was sent into the hospital, but I am greater part of his life has been passed in imminent unable to give any further account of him except peril from loss of blood, and he has been at death's that a diagnosis of payor Mocturnus was made, door from this cause a number of times. I do not which was only a part of his trouble. I am still un-know that I am warranted in calling this a case of willing to call this case tetany. The spasm involved hamophilia, though the hamorrhage was very severe the muscles of the trunk, which is rare except in the in its character. severest forms of tetany; the fingers were extended and abducted, instead of being flexed and abducted as in the hand when it is about to be introduced intothe vagina; there was no undue excitability of muscle or nerve to electricity, and the attacks were not provoked by pressure on the nerve or artery. Such a case. The above diagnosis, made by elimination e mbination of symptoms, therefore, is not like the during life, by Professor Kussmaul, was sustained by symptom complex of tetany, as given in the books, the result of the autopsy performed by Professor yet the condition was certainly curious.

Dr. Weeks: I have met one family of bleeders, who did not seem to feel the law of transition laid: down by the authorities. Some five or six years ago two healthy children; lives in a district apparently I was called to a little child about two years of age, healthy; no one else sick in the house. Was never who was teething, and had a slight abrasion of the sick before so far as she knows. Six weeks ago first gum from which a persistent humorrhage had been felt sick (unwohl). Malaise, inability to work; had going on for some time. I applied styptics, and after a red, papular eruption on the face, pain in the neck, a time the bleeding ceased and has never recurred, pain in swallowing. She was treated for a sore I learned that the elder boy, some ten or twelve years throat. The eruption disappeared in a week's time of age, was troubled in the same way when he was and treatment. After the disappearance of the an infant, and had since ourgrown the diathesis. The eruption, first noticed swelling, accompanied by family were of German extraction on the mother's pain in the shoulders, legs and sacral region; the side, the father was an American I believe. The swelling in legs soon passed off, appearing in the mother seemed quite an intelligent woman, and said arms. Last two week's pain in the neck, swelling that her father was a physician, and that the case of less marked. The pain, which was first sharp, has the elder boy troubled him somewhat; he said he become dull (dumpf). Pain has always been in the knew of no cases of the kind in his family or his muscles and not in the joints. Throughout the sick. father's family. This same boy I was called to treat, ness appetite fair, thirst marked, sweating, moderate some two years afterward. I went to Melrose where fever, constipation, no vomiting, urine scanty and the family had moved, and got there perhaps an hour after being notified, as 1 was out when called, and when I got there he had died of epistaxis.

hæmophilia was ever transferred to the offspring? Paresis of soft palate, electrical reaction in general Whether their children showed it?

ABDOMINAL SECTIONS.

and chief advocate, I desire to make brief reference posure. to Dr. T. Gaillard Thomas's article on "Laparatomy as a Diagnostic Resource," published in the Medical, and practice of surgery of the abdomen. This is News, Dec. 11, 1886. Therein Dr. Thomas expresses illustrated by the statement of an abdominal surgeon: in full Mr. Tait's views. They are simply without the "I do not count my first thirteen cases, because I mention of Mr. Tait's name, an embodiment of the was learning how to do it." In this there was considviews given vent to by Mr. Tait while on a visit to erable Rip Van Winkle arithmetic: "We won't count America in the autumn of 1884. Dr. Thomas would this one." The present good results in the hands of select the text of Mr. Tait's law, his own axiom, as young surgeons must not be attributed to the taking a motto for the walls of a hospital devoted to ab advantage of all the so called "latest antiseptic imdominal surgery. "When a doubt, as to the diag- provements." In this relation I will make brief alnosis of an abdominal neoplasm of a serious char- lusion to an experience with well trained young suracter, or of certain obscure pathological conditions geons, six in number, doing nine pelvic operations of the abdominal cavity which threaten life, exists, due to inflammatory trouble, suppurating, adherent, give the patient the benefit of explorative incision." and matted together pelvic viscera. The operations Mr. Tait, in like clean and terse English, expressed were all completed, with but one death, notwiththe same view in a clinical lecture at the Hospital of standing they were all bad cases. the Jefferson Medical College, Sept. 15, 1884, when In illustration I present a specimen of Pyosalpinx he said "My experience teaches me that it is a sur-removed by Dr. Thomas G. Morton. This patient gical crime to allow a patient to go to her grave had an enormously enlarged abdomen. She had without operation where it offers a possibility of respect been seen by a prominent gynecologist who had lief." Dr. Thomas, with great frankness, reports five plainly stated that there was no ovarian trouble and cases as examples of the class in which he had to recommended tapping, which was done. It is my regret non-interference on his part; cases in which impression that by the first tapping the large cyst "we" or "1" decided againt operation—the patients was ruptured, the dropsical accumulation followed died. Further he says: "I regret to say that I could Dr. Morton found upon examination, after repeating more than double the cases illustrating this part of the tapping, (the patient refusing any other operamy paper. Few such cases occur to me now for the tion) a small tumor or collapsed cyst. He refused very reason that I am a strong advocate for explora to repeat the tapping and urged section. He kindly tive incision as a diagnostic resource." As to another asked me to see the patient. Upon examination I class of cases in which Dr. Thomas meets with happy was fully satisfied of the correctness of Dr. Morton's results, he reports as follows: "There is a class of diagnosis and agreed with him in urging section. It cases in which, in my hands, explorative incision has was immediately done. Extensive adhesions had yielded such bridiant results that I shall devote full developed from the tappings, free hæmorthage folconsideration to it; I allude to cases of ascites in the lowed. He removed a large collapsed cyst, and by female." Mr. Tur, in the address I have referred to, irrigation large quantities of old clot. An interesting gave as as example in point a case operated upon feature of the ease was the existence of two pedicles, four years previous. "The patient, a young lady, the pelvic, and a fan shaped one over the diaphragm had an enormously enlarged abdomen due to ascites, and stomach. The case presented very interesting a fact I had recognized. Topened it by incision and instructive features.—Result: cure. for exploration and drainage: by this means the fluid is evacuated just as well as with the trocar, but you cannot feel anything with a trocar; but with a clean cut of two or three inches you can 1883, presented herself at the Philadelphia Dispenintroduce one or two fingers and find out the actual sary complaining of attacks of free bleeding and of condition of the pelvic organs as you can in no other pain in the left groin and left sub mammary region, way." The pioneer work done by Mr. Tait, his in-intensified by locomotion. On examination the fluence in exploratory work and treatment of diseased uterus was found low down and retroverted, the left conditions of the tubes, is referred to by Mr. Greig ovary was tender. On June 16, 1885, vulvo vaginal Smith in a very fair and generous spirit. "Tait's gland enlarged and tender: abscess incised and name is mainly connected with inflammatory diseases packed. Both ovaries were enlarged and tender. so as might have been expected from her dissipated Feb. 24, 1886. Complained of pain on coition, manner of living; other organs practically normal, January 25, 1887. Pain in right inguinal region. On examination there were found tortuous, cystic, boggy masses, filling up the whole right side of the pelvis. January 26, 1887. Dr. Price opened the abdomen in the median line, the incision being enlarged to three and a half inches on account of deep adhesions all by the first husband; no miscarriages, labors all to all of the pelvic viscera. The right tube charged with pus and the right ovary with a parovarian cyst as large as a cricket-ball, were removed, the pedicle ligated with silk and dropped. Free irrigation was employed; the wound was closed with silk.

PYOSALPINX.

Reported for T. S. K. Morton, M.D.

Mrs. S., white, æt. 36, complains of pain in right illiac region and extending down the right thigh increased by locomotion. General condition bad. Dissipated. Examination. Uterus in good position; to the right of cervix is a firm pedunculated tumor filling up the pelvic cavity on that side, firm, nodular and adherent. Operation, Jan. 25, 1887. A two inch incision was made two inches above the pubis, two fingers were introduced and everything found practically normal except the right ovary and fallopian tube. The ovary was as large as a pigeon's egg and firmly bound down in every direction and apparently more cystic than normal. The tube was likewise bound down, extremely thickened and contained fluid. After carefully examining all around the adherent mass, a point more friable than the other adhesions was found and torn up. This done the enucleation became a matter of patience and application of judicious force until the whole mass had been shelled from its inflammatory bed. When thus freed, the ovary and tube were brought out of the wound and the pedicle doubly ligated as near the ABDOMINAL SECTION FOR INTESTINAL PERFORATION. uterine cornu as possible and divided with scissors. Previous to dropping back the pedicle the remainder of the fallopian canal in it was thoroughly swabbed out with strong bichloride solution, 18 grs. to 3j. Scarcely any oozing took place and after thoroughly irrigating with water that had been boiled, and care-seized with severe abdominal pain, which shortly befully sponging the peritoneal cavity was found to be came intense in a spot two inches to the right of the perfectly dry. The incision was closed without a median line and three inches above Poupart's ligadrain. Time, 55 minutes. *Progress*. Occasional ment. The temperature varied from 100 to 104; slight nausea was the only untoward symptom fol- pulse from 120 to 140. Vomiting and purging and lowing the operation; evening temperature, 99 4°; slight balooning were other symptoms. The attendnext morning, 100°. After that it did not rise until ing physicians, R. and F. L. Haynes, diagnosticated the evening of the fourth day, when it mounted to perionitis from intestinal perforation. Reported for Dr. F. A. PACKARD.

Kate Taggaronni, white, let. 29, married the second time about two years ago. Had five children, easy and natural, made good recoveries and nursed all her children. Menstruation regular in time and quantity until November, 1886, when they were absent in November and December.

For the past month she had been bleeding freely, the hæmorrhages appearing in clots mixed with what seemed to be shreds of decidua. The breasts tingle but are not apparently enlarged; face blotchy; no abdominal enlargement noticed. She has had nothing like labor pains. The discharge is of bad odor. She has had no fever or chills. Examination showed a cystic tumor, in the pelvis to right of the uterus, about the size of gravid uterus of second month. Operation. On January 10, the patient being etherized, an incision three inches in length was made in the median line of the abdomen just above the pubis. Hæmorrhage from the abdominal wound was slight. A small cyst of the right ovary was found consisting of two chambers, one being filled with clear serous, the other with darker blood stained fluid. There was no adhesions. The cyst was removed unruptured; the pedicle ligated with silk and returned. The cyst was about the size of a small orange and sprang from the right ovary. The patient's condition after the operation was excellent. She had no rise of temperature or pulse, and no pain. Four stitches were removed on the fifth day and the remainder on the seventh day. There has been no return of the bleeding.

Reported for Dr. Francis L. Havnes.

Mrs. M., aet. 20, nullipara, had suffered for nearly a year from diarrhoea, cough with purulent expectoration, and symptoms produced by uterine disease and general weakness. March 9, 1887, she was suddenly inal pain and swelling now diminished and by the neum, drained and a dressing of iodoform gauze and third day after the section had entirely disappeared. The temperature gradually sank to normal. On the seventh day the patient became delirous, collapsed and died on the morning of the eighth day after the ing the school connected with this institution. section. No autopsy was allowed. It was thought that general tuberculosis was the cause of death.

(To be concluded.)

FOREIGN CORRESPONDENCE

SURGEONS AND SURGERY IN LONDON.1

St. Thomas's Hospital—Strangulated Hernia—Mr. Malcolm Morris-Mr. Pearce Gould-Mr. Timothy Holmes—Suppurative Inflammation of Shoulder Joint —Destructive Inflammation of Foot in Diabetes; amputation—Sir William MacCormac—Guy's Hospital; Its Museum—Congenital Hydrocele of the Cord— Mr. Thomas Bryant—Epithelioma of the Hands.

Dear Dr. Fenger:—A visit to St. Thomas's Hospital afforded me an opportunity to witness an operation for strangulated inguinal hernia by Mr. Sidney Jones, Senior Surgeon of the Hospital and Professor of Surgery in the school in affiliation with this institution. Full antiseptic precautions were observed, including the now almost obsolete spray. The patient, a man about 40 years of age, claimed that he was never aware that he had a hernia until the evening before, when a swelling formed rapidly in the right groin, followed by symptoms indicative of a strangulated hernia. When admitted into the hospital the lesion was readily recognized as a strangulated hernia and several gentle attempts were made to reduce it by taxis, but without success. tumor was nearly as large as a fist and very tense. A long incision was made down to the sac and all hæmorrhage carefully arrested before the peritoneal covering was laid open. On opening the sac a large mass of omentum came into view, underneath which a loop of intestine intensely congested was found. The omentum was divided into four parts just below external ring, tied with catgut, and the portion below the ligatures cut off and the stump returned. internal ring was divided in the usual manner, the loop of intestine drawn torward, examined and returned. At this stage of the operation it was evident that internal hemorrhage was taking place as arterial blood escaped from the empty canal. A search for the omentum through the opening proved fruitless and it became necessary to lay open the entire inguinal canal, but even this extensive enlargement of the wound did not afford access to the retracted. omentum, and the abdominal wall was incised for at least three inches more, when the omental stump was found and brought into the wound. One of the ligatures had slipped and caused free arterial hæmorrhage. The hiemorrhage was arrested by the application of another catgut ligature and the stump again reduced. The neck of the sac was tied and stitched into the wound. The extensive wound was closed with deep sutures including the perito-

cotton applied. This hospital is one of the best in London, contains 600 beds, which furnish the material for clinical instruction for the students attend-

A visit to the residence of Mr. Morris afforded me an opportunity to examine an excellent collection of renal calculi removed by nephro-lithotomy. Mr. Morris is a young surgeon of great promise, who has had an unusually large number of cases of renal surgery. He is one of the surgeons to the Middlesex hospital and enjoys a good reputation at home and abroad.

A call upon Mr. Pearce Gould, who lives in the same part of the city, was remunerated by a profitable conversation touching upon recent topics in surgery. Mr. Gould is a thorough scholar and an able surgeon, and has done excellent work in the Middlesex hospital.

At St. George's hospital, I made the acquaintance of Mr. Timothy Holmes, the author of a voluminous, and I might say the best, English text-book on surgery. Although advanced in years he still retains his youthful energies and continues his work of giving regular clinical instruction. A female, 20 years of age, suffering from a suppurative inflammation of the shoulder joint, furnished the subject of his clinical lecture on this occasion. A contracted, fistulous tract commencing at the lower margin of the pectoralis major communicated with the shoulder joint. The joint was laid open by a straight anterior incision, and after severing numerous adhesions the upper extremity of the humerus was brought into the wound and the bone divided with an amputation saw just below the tuberosities. Parts of the capsule were removed with curved scissors and a drain introduced through the fistulous tract which had been previously scraped out and dilated. The dressing consisted of a thick compress of antiseptic guaze. He said nothing about the pathology of the case but made the assertion that in such instances it is superfluous to make the operation subperitoneal as such a procedure would be of doubtful advantage, but in case it became necessary to divide the bone at a lower level the periosteum should be preserved. The best functional results he has seen after excision of the shoulder joint were patients who could raise the arm to a horizontal position.

When Mr. Holmes finished his remarks Mr. Hayward took his place and presented a diabetic patient who had recently become the subject of a destructive inflammation of one of his feet, which had terminated in extensive sloughing which had opened the ankle joint. Amoutation was performed at the junction of the middle with the upper third of the leg, by making a long anterior and short posterior flap. The periosteal flap was made, and the flaps were sutured in the ordinary manner and a transverse drain introduced. A gauze dressing was applied. In this connection I will give you the result of a conversation with Professor Koenig a few days ago, concerning the propriety of resorting to amputation in diabetic patients suffering from gangrenous inflammation of an extremity. He stated that while

Franklin H. Martin, M.D. 163 State St., Chicago, May 30, 1887.

BOOK REVIEWS.

MEDICAL ELECTRICITY. A Practical Treatise on the Applications of Electricity to Medicine and Surgery. By Roberts Bartholow, A.M., M.D., LL.D., etc. Third Edition, Enlarged and Improved. With Illustrations. Svo, pp. 304. Philadelphia: Lea Brothers & Co. Chicago: A. C. McClurg & Co.

This book, in its preceding editions, has been before the public long enough to be well known. the works written by Professor Bartholow are deservedly popular, for they are clearly and well written. The present volume covers the usual ground gone over by treatises on this subject. Electricity, its nature and modes of manifestation, are first considered; then the means of generating it; later electro physiology, or its physiological action; and finally its use as a diagnostic and therapeutic agent. The additions to this edition have been chiefly to the sections on therapeutics. The portions devoted to electric illumination and galvano-cautery have been enlarged. Galvano-faradization and electric baths are also described." Without doubt this edition will maintain the popularity of the work.

MISCELLANEOUS.

NEW HAMPSHIRE STATE MEDICAL SOCIETY.—The ninety-seventh annual meeting of this Society will convene in the Opera House, North Main Street, Concord. N. II., Tuesday, June 21, 1887, at 11 o'clock A.M. The Councillors will meet in the office of Dr. Conn at 8:30 P.M. of the previous evening. June 20. Prof. Carlton P. Frost, Hanover, President; Dr. G. P. Conn, Secretary.

STATISTICS OF TYPHOID FEVER.—In an Amsterdam! graduation thesis, by Dr. M. Niemeijer, on the Statistics of Typhoid Fever, out of fifty cases in which complete observations were recorded, prodromata occurred in twenty five, rigors in sixteen, "cold shivering in one, pain in the left side in seven, diarrheea in forty two, splenic enlargement in forty-eight, rash in forty seven, ileo caecal gurgling in nineteen, and Tryon, Rufus J., Surgeon, detached from the U. S. Str. "Quinpain in the same region in twenty, bronchial catarrh in forty three, albuminuria in twelve, in three of which eystitis followed. In sixty-three cases, relapses occurred six times. With regard to complications, out of seventy-three cases, intestinal hæmor-rhage occurred in five; peritonitis in three, perfora-list converge in two of these. Other complications tion occurring in two of these. Other complications

trodes changed or rearranged, so that the required were: pharyngitis, one; acute follicular sore-throat, current may be obtained without pain. The greatest one; parotitis, one; epistaxis, three; laryngeal care must always be observed in the selection of perichondritis, one; pulmonary infiltration, thirteen; electrodes and the proper manipulation of the cur- pleurisy with effusion, three; thrombus of the crural vein, one; acute nephritis, one, in a somewhat doubtful case; nephrolithiasis, two; herpes labialis, three; cutaneous hæmorrhage, three; periostitis of the tibia, one; joint-affections, three; meningitis, one; neuralgia of the sole, one; profuse perspiration, two; polyuria, one; mental disturbance, four; deafness, five; bleeding from the ear one. The total number of patients on whom observations were made was 194. Of these, twenty, or 10.3 per cent., died, the male mortality being decidedly higher than that occurring amongst female patients—12.5 per cent., as compared with 6 per cent.—British Medical Journal, May 7, 1887.

> GASEOUS TREATMENT OF CONSUMPTION. - Dr. Henry Leffmann, Editor of The Polyclinic, (P. O. Box 791, Philadelphia), desires to obtain results of the new treatment of Pulmonary Consumption and Phthisis by gaseous enemata, for publication in The Polyelinic. The correct therapeutic value of this method can only be arrived at by the collection of statistics, and he therefore requests any one who has administered the gas to communicate the result to him, the formula used, and any special information that may be useful.

> ABDOMINAL SECTIONS.—Professor Joseph Eastman, of Indianapolis, Ind., recently reported the results of twenty four cases of abdominal section with twenty recoveries. Four were operated on in the City Hospital, ten in his private hospital, and ten in private residences. In twenty-two of the cases the operations consisted in removal of one or both ovaries, and in fifteen of these, the tubes were included. The operation was exploratory only in one case, revealing encephaloid disease of the left ovarium and adjacent parts; and in the remaining case a fibroid tumor of the uterus was removed, weighing six pounds.

ADDRESS IN MEDICINE.

Delivered before the Section of Practice of Medicine, Materia Medica, and Physiology, at the Thirty-Eighth Annual Meeting of the American Medical Association, at Chicago, June 8, 1887.

BY JOHN S. LYNCH, M. D.,

OF BALTIMORS, MD.

In searching the records of this Association to find how my predecessors have discharged the duties of the position which the partiality of my fellows in the Section on Practice of Medicine, Materia Medica and Physiology has assigned to me, in order that I might profit by their illustrious examples, I find that with rare exceptions, these addresses have not been (what the Association originally intended they should be) a review of the advances and discoveries made during the past year in the branches of medicine in this section; but have consisted of discussions of a single topic which has recently most prominently occupied the attention of the profession. If I should there are really so many subjects of transcendent of which so much could be said, that I should finally neither satisfy myself nor the audience I address by the selection I should make. Moreover, as most of these topics would necessarily have to be discussed in a manner more or less speculati e, it occurs to me that few would take any interest in my speculations upon any of them. I shall, therefore, as briefly as I can, glance at some of the discoveries, or pretended departments of medical science, not of this year alone, but during the past few years. For while the time of the announcement of a discovery or advance, may constitute an important epoch long enough to be remembered afterwards, it is only after long trial during which the real value of the discovery is to be tested, value.

ANTIPYRETICS.

keeping down morbidly high temperatures constitute ers to produce final exhaustion and death. What we the most powerful weapons we possess in combatting wanted then was something more certain and effective a large majority of the diseases to which mankind is than quinine, less disagreeable to the stomach, and heir to. As I grow older and my experience enlarges less injurious to the nervous system, and free from I become more and more convinced that fever is the any poisonous effect, that would put out the fire by lethal agent which destroys life in almost every dis stopping combustion—an antipyretic.

ease in which that functional derangement is present. Whether in specific diseases or common inflammations it is most frequently the morbid high temperature by its wasting destruction of tissue, the arrest of nutrition and the associated derangements of function that determine the fatal result. Of course in the so called specific fevers it is the sole destructive agency. In consumption (which in temperate climates destroys nearly one-sixth of the population) it is the accompanying fever and its grade which determines the duration of the disease. Ninety cases in a hundred of pulmonary consumption die from asthenia long before the destructive processes going on in the lungs have deprived the patient of a sufficient amount of his respiratory apparatus to destroy his life. He dies not of apnœa but of asthenia. Even in ordinary inflammations it is usually the fever that kills and not the destruction of the organ inflamed; while the fever, although perhaps at first directly caused by the inflammation, reacts upon it, continues and intensifies it.

Until a very few years ago we had but a single follow the example thus set me I would be greatly agent that could be used successfully as an antipypuzzled in making the selection of such a topic; for retic, and this was so uncertain and so irritating to the gastric mucous membrane that it often failed us, importance crowding upon our notice, of either one and still more frequently could not be tolerated in doses sufficiently large to do its work. Indirect antipyretics of great activity we possessed in veratrum viride, aconite and digitalis, but these were too energetically poisonous to be safely used on all occasions. Apyretics—that is medicines which increased heat loss—we had in abundance; but these could not be continued long, for although the nervous system may be protected from the directly injurious effects discoveries, advances, or hoped for advances, in our of heat, by them, they did not arrest the too active combustion going on and the patient died of exhaustion almost as soon as if left alone. We may heap ice on our steam boiler and thus prevent the formation of steam, or perhaps cause its recondensation as soon as formed, but we do not stop the consumption of coal in the furnace underneath. And so, too, we that we can accept it as of proven and established may by bathing, sponging or sweating keep down the temperature of the body externally, but the combustion is still going on internally, not quite so rapidly Unquestionably the means of safely reducing and perhaps, but still at a sufficient rate in protracted fev-

This most desirable agent has been found in a expended in stamping out the pestilence. Yet this ber, 1884. I began its use in all diseases attended with against its ravages. a single person die of enteric fever, scarlatina or sputa of tuberculous patients, and by experiment on late), and that the duration of cases of phthisis seems tablished an etiological relation between this microbe combined with other alkalies.

latter, which is unfortunately a patented article; but more difficult of administration.

CARDIAC STIMULANTS.

During the past year two new cardiac stimulants have been brought to our attention, for one of which the valuable claim was made, that it energized the heart without increasing arterial tension. I have used the substance, which has been called strophan tin, but have not been able to realize the valuable properties claimed for it. Spartein sulphate I have used in a single case only, but it produced in my patient such an intense, agonizing headache that I have not ventured to prescribe it a second time. hardly possible that we shall ever find a better remedy for all cardiac lesions than digitalis, which combines the two valuable powers of energizing the heart and stimulating the action of the kidneys at the same time.

PHTHISIS.

The etiology, prevention and cure of pulmonary phthisis must always be to us as well as to the people at large a subject of paramount interest. As already stated it is the cause of death throughout the tem perate zones of our planet of nearly one sixth of the population. It destroys more people probably than war, pestilence and famine combined. All the so called zymotic diseases together, including cholera, yellow fever, malarial fever, small pox, diphtheria, scarlatina and measles, do not destroy so many of our race as this deadly foe to human life. If an epiyour city and produce an annual mortality one half cilli. of that produced by consumption alone, public indig. | showed virtually the same thing. nation would be aroused against the inefficiency of

fever, and my own estimate of its value may be in- "It was sincerely hoped that when Koch announced ferred when $\hat{\mathbf{I}}$ say that since that date $\hat{\mathbf{I}}$ have not seen—his discovery of a peculiar microbe in the lungs and measles, only one of croupous pneumonia (seen too some of the lower animals had, as he supposed, esto be very nearly doubled. In acute inflammatory and tuberculosis, that one step had been made in rheumatism it seems to be scarcely less efficient than advance towards preventing at least, if not curing, sodium salicylate. The dose should be about one this dreadful disease. His discovery was hailed with gramme, repeated at first every hour until three doses delight, and his conclusions were accepted without have been taken, and afterwards every three or four question (and I might add, almost without reason) hours. It is very soluble in water, has a slightly by a large majority of the ablest and oldest members pungent and bitterish taste and rarely excites nausea. For the profession. For a long time we heard of If it should do so it may be given in lime water or scarcely anything but the bacillus tuberculosus and the contagiousness of phthisis. In order to make Another substance belonging to this class of facts conform to theories, even the able and rational remedies has recently been brought to our attention views of Virchow and Niemeyer in regard to the under the name of acetanilid, and has been sold in nature of tubercle were discarded, and the older and some of the shops as antifebrin. From a few ob-|cruder doctrines of Laennec were revived, that servations it has been found to be even more power- everything is tubercle that has or can undergo the ful in antipyretic action than antipyrin. It has the caseous transformation or degeneration. The idea advantage of being very much cheaper than the that the bacillus tuberculosis might be the special agent which attacks and destroys dead cellular it has the disadvantage of being entirely insoluble in masses that have undergone the caseous degenerawater and alkaline solutions; and for children, there-tion, whatever may have been their origin; just as fore, who cannot swallow pills or capsules it is much the vibrio and its congeners attack pus; the yeast plant saccharine solutions, which in turn, when fermentation ends, is attacked by the bacterium of active fermentation; the ordium albirans particles of putrefying milk in the mouth of an infant; and the micrococcus the plastic exudations of croup and diphtheria, was scouted by the followers of Koch asabsolutely absurd. And yet, more recent and careful experiments seem to show that this is probably the truth, and that the bacillus tuberculosus is only pathogenic when previous pathological changes have produced the conditions favorable for the growth of the microbe, or the animal is placed under such conditions as to invite and cause those pathological

The recent experiments of Dr. Truesdale, of New York, related in a paper read before the Climatological Society at its last meeting in Baltimore, show this, we think, with tolerable clearness. This gentleman took fifteen rabbits, which he divided in three equal groups. Five were inoculated with Koch's bacilli and placed in a damp, dark cellar and insufficiently fed on unwholesome food. They all became sick and died with tubercles. Five others were placed in a damp pit and badly fed, but were not inoculated with tubercle. One of these died and all became sickly. When killed no tubercle bacilli were found, and, as far as he could see, no tubercles. The last five were moculated with tubercle bacilli and turned out on a rich pasture, with plenty of air and abundant, wholesome food. They remained perfectly demic of cholera or small pox should break out in healthy, and when killed showed no tubercles or ba-Sternberg's experiment several years ago

changes.

Now, what is the rational deduction to be drawn your health boards, and millions of dollars would be from these facts? That tuberculosis is a contagious this infection is the bacillus tuberculosis? Surely complete induration of the lower lobe of his left not, because even rabbits, who are more prone to lung, but still remained in sufficiently good health to tuberculosis than any other animal, except, perhaps, follow that laborious occupation. At last, however, their congener, the guinea pig, cannot be infected by the mass began suddenly to break down, and he died inoculation when placed in good hygienic conditions, in about four months from pulmonary phthisis. The and sufficiently supplied with wholesome food. But case of this man was particularly interesting and init may be said that other animals not reckoned among structive, as showing that the danger from bad hygithose liable to tuberculosis, as the dog and cat, have enic surroundings, and especially from bad air, is been infected with inoculations of bacilli. This is even greater than the danger of direct contagion. true, but in order to accomplish this the microbes. He married a young woman who was then in good must be introduced into a serous membrane, where health and remained so for six years. The entirely spontaneous, and inspired only by the entheory upon which this treatment is based is that this thusiasm and energy of their authors. gas is absorbed through the intestinal mucous membrane and exhaled through the pulmonary surfaces, and, coming in contact with the pathogenic microbes there, destroys them. Dr. Bergeon must have forgotten that these microbes are not found in the alveoli free from disease, and where, if at all, the gas must be exhaled, but in the solid tubercular masses occupying these air sacs, into which the gas can hardly penetrate, and from which no exhalations take place. Even then, admitting that his mixed gases can destroy the microbes, which seems highly improbable, in view of the fact that they are continually exposed to an atmosphere so highly charged with carbonic dioxide that its retention in the lungs for five minutes will produce unconsciousness, it is not clear how they are to reach the objects intended to be tient, but seemed to be inevitable. destroyed. Accordingly, we find that in other hands eral cases, and I can report nothing in favor of the some other cerebral nerves. treatment. MEDICAL PROGRESS.

Antipyrin and Antifebrin in Headache Lyman, who had been induced to try the remedy N. Weljaminow (St. Petersburg med. Wochen., after the publication of Ungar's success, administered 1881, VI, p. 455–7) reports a successful case of tree it in several cases of neuralgia of the cervical, facial, tween the brain and dura. Death in a few days, which have proved to be of great value in his hands Sylvestrini (Bull. de l' Acad. de Med., Paris, 1883, in several varieties of headache, and he witnessed no p. 439), reported a case of kick from a horse over evil results from doses of even 23 grains. Lyman the right temporo-frontal region of a boy aged 15. used an initial dose of 15 grains, repeated two or Two months after the injury, temporary right hemitother three times if necessary, and relieved the paroxysms, plegia. Five months later, paralysis of right arm but did not prevent their recurrence. In March and leg and lower part of right side of the face, last I began a trial of this drug, and afterward its complete aphasia, incontinence of urine and fieces, successor, antifebrin, in a variety of headaches, in right hemi-epilepsy. He trephined over the centres insomnia, and in epilepsy. Some of these cases had for the upper and lower extremities, extracted piece-been treated with more or less success with the salicymeal a hard organized clot. Patient died on fourth late of sodium, and the usual remedies, and the cases of epilepsy were under modified bromide or Hulke (Lancet, 1883, Vol. II, p. 814), in a case of other treatment. The cases of headache selected blow over the right temple followed by right hemi were those of migraine of angeio spastic and angeioplegia and coma, and later spastic rigidity of the paretic varieties, as well as ordinary facial or subleft arm, trephined and evacuated inflammatory fluid occipital neuralgias; and the cases of epilepsy which by dural incision. The cerebral symptoms disap- were chosen were those of the symptomatic form complicated with objective and subjective indication of cerebral disease, as well as the simpler forms

In angeio spastic migraine with evidences of cutaneous anæmia, dilated pupils, and coldness, the Bryant (Lancet, 1884, Vol. II, p. 823), in a case headache commencing in the morning, I found both paroxysms after the first dose.

In four cases of epilepsy in which either antipyment in three of the cases, in each of which there was post epileptic headache; and aggravation of the disease in the fourth, the patient's paroxysms being symptomatic of coarse cerebral disease. In one case of pure hystero-epilepsy the beneficial action of the remedies were absent.

I have also used both drugs in cases of habitual insomnia in doses varying from 3 to 8 grains of the antifebrir, and 10 to 20 of the antipyrin, without appreciable result, though in a case of maniacal excitement, due to nervous exhaustion and connected with moderate rise of temperature (102° F.), 15 grains of antipyrin repeated twice produced refreshing sleep and a subsidence of excitement. There can be no doubt, however, that in wakefulness due to general disease, especially with high temperature (and I have seen such), the value of both of these drugs as hypnotics is very great.

It would seem as if both remedies were of value or in the excitement due to cell mal-nutrition and exhaustion; and, though antipyrin seems to be the which do not belong to antifebrine. It would ap- and ether. Schmidt proposed a mixture of iodol, 1 pear as if the remedies were valueless or even harm-part; alcohol, 16 parts; glycerine, 34 parts. [This ful in cases of organic or symptomatic epilepsy, but is, however, too weak. Lublinski has used the worthy of a trial in the light cases attended by powder pure for laryngeal insufflation. It causes rather general cerebral vascular spasm and not much no pain or cough, and it remains a long time in conmuscular movement. In several cases of petit mal tact with the surface. He has used it in the treatthe good effect of continued doses of antipyrin and ment of fifteen cases of tuberculosis. He adminantifebrine is manifest, for the losses of conscious istered one insufflation daily, or, in some cases, two ness are far less frequent than when the patients or three times a week. THE BERGEON METHOD AGAIN.

It was with some surprise that many members of the Association heard the Chairman of the Section on Practical Medicine, in his address last week, utterly condemn the Bergeon method, after making the indefinite statement that he had given it a "fair trial." The rationale of the gaseous treatment of phthisis has been given so fully in former issues of THE JOURNAL that it is quite needless to go over the ground again. But it seems that certain facts in regard to the method need repetition.

Whatever may be the reasons assigned for the use of any method or drug, the value of it must depend on the results obtained in actual practice. If a The thirty-eighth annual session of the American theory seem to be correct and success be not obreach the objects intended to be destroyed. Accord-Cincinnati, O., was selected as the place for the ingly we find that in other hands the plan has proved number of men, other than Bergeon, this method anything to scientific men. has given good, if not satisfactory, results.

too early to draw definite and exact conclusions as to the value of Bergeon's method. But however wrong Bergeon's theory may be, if it be wrong (and so high an authority as Cornil has not found objections to it) the fact remains that good results have been obtained than this, the scientific world is not satisfied with such assertions as that one or two men have given a method a "fair trial." The details of the trial should be given, after which it is no difficult matter to see whether or not mistakes were made in the experiment. Mankind is too prone to error to accept unsupported assertions. Too fresh in our memory, in connection with this subject, is the statement made four years ago by an eminent pathologist that he had caused tuberculosis in rabbits by the inoculation of inert substances—and the subsequent proof that his methods were faulty and his statements incorrect.

Is antiseptic, or aseptic, medicine an impossibility? Is it true that anything which will destroy microbes must necessarily also destroy the cells of living body-Do we not know already that different microbes are differently affected by so-called germicides, and by different agents? And do we not constantly see such things in relations to creatures of a higher plane? Why should we assert positively that whatever will kill germs must destroy living body-cells, when we know that parasites of a higher order can be destroyed and expelled from the body without injury to the patient. There are men living to-day who would have asserted twenty-five years agofifteen years ago-that aseptic surgery was impossible; and there are still those who endeavor, despite the light set before them, that antiseptic surgery and obstretrics is a myth-a delusion. There are very, very few things of which we can assert impossibility. And, certainly, the labors of Selmi, Gautier, Tanret, Brieger, Brouardel, Martini, Dujardin-Beaumetz and Goetze may be said to be a sufficient answer to those who assert that antiseptic medicine is impossible.

There is, as we said a few weeks since, a tendency among American physicians to run after novelties. But while avoiding a headlong rush after new things let us avoid the opposite extreme, and by all means let us not decry honest work. Whatever is bad must be shown, proved, to be bad by actual experiment and trial; what is good we must remain in ignorance of until it is shown to be good. But the

no other criticism than to say that in the hands of a day is past when assertions can prove or disprove

To conclude this matter, as to Bergeon's method As we have already said in a former editorial, it is and antiseptic medicine, we may quote the conclusions of Dr. E. L. Trudeau, of Saranac Lake, N. Y., in a paper entitled "A case of Phthisis treated for eight weeks by Rectal Injections of Gas. Notes and Experiments," which may be found in the Medical News, April 23, 1887: The gas as it enters by the practical application of the method. More the body appears to have no germicidal value whatever. A satisfactory conclusion as to the real therapeutic merit of this method, cannot necessarily be reached for many months to come, but so far as the evidence procured by its application to one case for so short a time may be of value, it would seem that rectal injections of gas by Bergeon's method have a beneficial influence on the suppurative processes of phthisis. The method seems deserving of a most thorough and extended investigation, and though the treatment may prove in the future to be a useful therapeutic measure, a consideration of the facts here presented does not in the least warrant the assumption that a specific for tuberculosis has been discovered.

FOOD ADULTERATION.

A recent issue of the New York Horld contained a list of adulterants found in articles of food and drink, which is instructive reading to the public generally, and to sanitarians particularly. It is of interest to every dweller in a civilized community, and of quite as much importance to this country as its commerce, the improvements of its rivers and harbors, or any questions of coast defense. On reading the list one is amazed at the ingenuity and dishonesty of civilized, Christian man. The majority of our foods and condiments, of our articles of drink, are so adulterated that it may now well be said: he is a wise man who knows what he is eating. It has not been very long since we commented on this subject—but so long as the evil exists it is of importance that repeated attention be called to it. Below we give the list as printed in the World:

Coffee (ground) .- Chicory, peas, beans, date-stones, biscuits, figs, roasted hominy, burnt sugar, acorns, mangel-wurzel, dandelion, turnips, parsnips, carrots, and rye and potato flours.

Tea —Exhausted tea leaves (faced or colored and fixed up with plumbago, gum, indigo, Prussian blue, turmeric, China clay, mica, soapstone or French chalk, sulphate of lime, rose pink, Venetian red, carbonate of copper, arsente of copper, chromate and bi-chromate of potash, and carbonate of lime and magnesia), leaves of the elder, willow, sloe, and other plants and trees, lie tea, paddy husk, sweepings of the tea-house floors, sand, quartz, starch, and magnetic oxide of iron.

Sugar (cane).—Grape or starch glucose, wheat and potato flours, tapioca starch, blood, pipeclay, marble dust, gypsum, bone dust, lead, iron, lime, sand.

Cocoa and chocolate.—Arrowroot, sago, starch, chicory,

and Indian flours, tapioca, cocoa husks, old sea biscuit, potatoes, molasses, and animal fats, such as tallow and lard.

Wheat flour.—Adulterated with inferior or old flour, potato flour, ground beans, peas, rye, barley and rice, alum, chalk, gypsum, soapstone and carbonate of magnesia.

Buckwheat. - Wheat and other flours.

Honey.—Cane sugar, chalk, sulphate of lime, pipeclay, gypsum and glucose.

Lard.—Oleomargarine, cotton-seed oil, potato flour, water, mutton suet, alum for color, carbonate of soda (for taste, caustic soda (for taste or smell).

Cream tartar.—Gypsum, starch, acid-phosphate of calcium, tartarie aeid.

Saleratus.—Most of what is now sold as saleratus is bi-carbonate of soda.

Bi-carbonate of soda, or baking soda. —Gypsum, sulphate of sada, chrome yellow for coloring. soda, carbonate of lime.

Sugar confectionery.—Glucose, terra alba, chalk, arrowroot, sand, wheat, and potato flour, hydrated sulphate of lime, with -for coloring-cochineal, lake, indigo, and Prussian blue, car-bonate of copper, carbonate of lead or white lead, vermilion, gamboge, chromates of lead, sap green, arsenite of copper, Indian red, umber, sienna, Vandyke brown, cobalt, smalt, litmus, Naples yellow, bi sulphuret of mercury, sulphuret of

arsenic, bronze powders or alloys of copper and zine.

Mustard.—Flour, turmeric, cayenne pepper, ginger, plaster of paris, linseed meal, radish seeds, chromate of lead, gypsum, sand.

Oatmeal.—Barley meal, rice and corn flour, ground husks of

Wheat bread.—Barley, oat and pea flours, bone dust, carbonates of lime, magnesia and soda, sulphate of copper and lead ehromate for color, alum for taste'.

Cheese.—Oleomargarine, lard, cotton-seed oil, borax, saltpetre, potatoes, beans, soapstone, soda, potash, urine, sulphate of zinc, blue vitriol, arsenic in foreign cheese).

Butter.—Oleomargarine, cheaper fats, cotton-seed oil, alum, borax, barium, chalk, flour, gypsum, lead carbonate, yellow lead chromate, potato flour, salt, soapstone, starch and sodium silicate or soluble glass.

Arrowroot.—Sago, potato and tapioca starches, and ground rice.

Cinnamon.—Cassia and most of the other spices, flour, meal, and arrowroot.

Pepper.—Ground rice and beans, mustard husk, salt, oilcake and clay, and for colors red lead, vermilion or bi-sulphuret

of mercury, Venetian red, turmeric and charcoal.

Ginger.—Wheat, sago and potato flour, ground rice, mustardhusks, turmeric.

Maple sugar.—Cane sugar, glucose, and flour.

Chicory.-Roasted wheat and rye flour, burnt beans and acorn's carrots, mangel-wurzel, roasted biscuit, sawdust, and oak-bark tan.

Sago.—Potato flour.

Vinegar.—Water, with burned sugar for color, sulphuric acid, acetic, hydrochloric, nitric and tartaric acids, cayenne pepper, salt, and mustard seed.

Pickles.—For coloring, acetate of copper, Sauces.—Chalk and plaster of Paris, and for coloring red earths.

Marmalade. - Pulp of apple or turnip.

Olive oil.—Cotton-seed oil and the cheaper oils of the poppy, peanut, grape seed and beachnut, and coaloil, with lead to cor-

rect rancidity and copper for a greenish color.

Brandy.—Water, corn spirits, molasses, burnt sugar for color. Artificial brandy made from other spirits and flavoring extracts is common.

Gin.-Water, cayenne, flavoring extracts, slum, and salt of tartar (for fining , sulphuric acid, coriander seed, oil of almonds, calamus root, orris root, orange peel, acetate of lead, oil of turpentine, and gray and white salts for taste or smell,

Rum.-Water, cayenne, burnt sugar, and cocculus indicus for

taste or smell.

Whiskey.—Principally water, cayenne pepper, bitter almonds, tonka bean, burnt dried peaches, beet root, and a variety of flavoring extracts, sulphuric acid, creasote, and sweet spirits of

Wines.-Mixtures of inferior wines, cider, and the juices of rhubarb, gooseberries, and pears, with-for coloring-logwood,

ferrugmous earths, chalk, oxide of iron, sulphate of lime, wheat elderberry juice, Brazilwood, bilberries, burnt sugar, black cherries, and cochineal, and for taste and smell, sulphate of potash, bitartrate of potash, lead, oak sawdust, catechu, cherry-

laurel water, carbonate of soda, and artificial flavorings.

Ale, beer and porter.—Water, with, for taste and smell, cocculus indicus, opnum, cayenne, ginger, quassia, colocynth, caraway and coriander seeds, orange powder, honey, licorice, sulphate of iron, sulphuric acid, cream of tartar, camomile, alum, carbonate of potash, nitric acid, horehound, blessed thistle, sweet flag, gentian, aloes, molasses, juniper berries, burnt flour, isinglass, albumen, ivory, black gypsum, salt, glycerine, salicylic acid, decoction of calves' feet, glue, copperas, henbane, belladonna leaves, nux vomica, hartshorn, strychnine, tobacco, shavings and oyster shells.

Milk.-Water principally, flour or starch, boiled white carrots, milk of almonds, sheeps' brains, gum tragaeanth, earbo-

As medical men we are concerned with the detection and punishment of dishonesty only when its results are injurious to health. It requires no great amount of argument, however, to show that food adulteration is prejudicial to health. From causes which we need not stop to mention the American public has come to be too lenient with the dishonesty which shields itself under the name of "business." Such laws as we have for the protection of health and life are, as a rule, improperly enforced. As self-constituted conservators of public health should we not bring this matter before our legislative bodies—not once, but repeatedly—until this disgrace is wiped out from the country?

Can there be any wonder after reading the above list, that we are a nation of dyspeptics? While it may be said that many of the adulterants of our foods are innocuous, it must be admitted that others, taken repeatedly, even if in small quantities, are injurious—and are certainly not foods in the common acceptation of the term. For example, an enormous quantity of tea is consumed in this country, and a reference to the list will show that tea is more largely and more perniciously adulterated than any other article in such common use, except, perhaps, malt liquors. The consumption of sugar confectionery by children is very large—and the adulterants of this article are by no means harmless. And when it is remembered that milk is the principal food of a very large proportion of the population-young children-who can take no other food, the possible and almost certain injury may well cause us to endeavor, by every possible means, to throttle an evil which is worse than the plague.

NINTH INTERNATIONAL MEDICAL CONGRESS.

The Executive Committee of the Ninth International Medical Congress held a full and harmonious meeting in the Palmer House, Chicago, on the 6th and 7th inst. Full reports were made by sub-com-

mittees and the chief officers of the Sections, which gated by the inhalation of the dried bacillus from the showed a most satisfactory degree of progress in all expectoration of diseased persons, by persons predisthe necessary arrangements for a large and successful Congress. The several Sections are well organized, and for the most part with arrangements for an abundance of scientific and practical work of importance, furnished in fair proportion by parties of reputation in other countries. The local arrangements at Washington are also rapidly maturing, and include regular work, but a series of appropriate entertainments and probably an excursion for the foreign guests to Niagara Falls and return to New York, after the close of the Congress. An outline of the whole programme will soon be given to the public.

PERTUSSIS IN A CAT.—MR. O. BOWEN, of Liverpool, reports this rare case of infection of one of the lower animals from a human being. The cat was infeeted by a little boy, and for about two weeks had five or six distinct fits of coughing daily, similar in never contract the disease. every respect to those exhibited by the boy, with expectoration of frothy mucus afterwards. Between the attacks the cat was bright and active, though not so much so as before, and lost flesh during its illness.

SOCIETY PROCEEDINGS.

AMERICAN CLIMATOLOGICAL ASSOCIATION.

Fourth Annual Meeting, held in the Johns Hopkins University, Baltimore, Md., May 31 and June 1, 1887.

Tuesday, May 31—First Day.

Afternoon Session.

The Society was called to order by The Presi DENT, FRANK DONALDSON, SR., M.D., of Baltimore, who delivered the President's Address.

PROPHYLACTIC TREATMENT OF THOSE WHO INHERIT A PREDISPOSITION TO PHTHISIS.

Thirty per cent, of the cases of phthisis have an inherited predisposition to the disease. The hereditary form, when developed, offers the least prospect of recovery. Reference was made to the pathology of the disease. Five years have elapsed since the contagion of tuberculosis was alleged to have been discovered, and nearly all observers have now confirmed the views of Koch. There is abundant evidence that human subjects readily yield to the bacillus

posed to tuberculosis. The various theories which had been advanced to explain heredity were discussed. The prophylactic treatment embraces two elements: 1, the improvement of the general health of the subject; and 2, the protection from contagion. The tuberculous mother should not nurse her child, but if possible it should be given to a healthy wetnurse. The hygiene of the nursery should be looked after carefully. The room should be well ventilated not only the best possible accommodations for the and kept at a comparatively low temperature. The subject should live much out of doors, especially between the ages of 15 and 20 years. The beneficial influence of sunlight should be borne in mind. All causes of glandular irritation should be avoided. Scrofulous glands should be dispersed or removed. The physical form of the chest should be enlarged by gymnastic movements. If possible, life should be passed in a high altitude. Oleaginous fluids are useful if they can be digested. The milk and flesh of tuberculous animals must be avoided, for cooking rarely destroys the bacilli of beef. If the prophylactic treatment is thoroughly carried out, the hereditary proclivity may remain latent and the individual

> DR. B. F. WESTBROOK, of Brooklyn, said that the anatomical and physiological conditions which predispose to this trouble are, according to the results of certain observations, a disproportion between the size of the heart and the lungs, the heart being smaller in proportion to the size of the lung than in the ordinary individual, and a disproportionately small digestive apparatus. The former condition interferes with the circulation at the apices of the lung, while the latter condition causes a lack of nutrition.

> DR. JAMES R. LEAMING, of New York, read a paper on

THE PHILOSOPHY OF CLIMATIC TREATMENT OF DIS-EASES OF THE CHEST.

The author stated that it had been observed that the greatest improvement takes place during the first three weeks of the patient's stay at a new place. The suggestion was made that a line of resorts be established along the Atlantic seacoast. The patient could begin in the summer at the most northern and gradually pass southward, making a stay of a few weeks at each place. Having completed the series, the patient may return, taking the stopping places in a reverse order. This same plan might be applied to the Pacific coast and to the mountains. The speaker also suggested the propriety of State and municipal authorities furnishing sanitariums for the benefit of those unable to avail themselves of the advantages of existing institutions.

Dr. R. G. CURTIN, of Philadelphia, read a paper

THE INFLUENCE OF SEA AIR ON SYPHILITIC PHTHISIS.

He gave in detail the histories of five cases of poison when previously they have been in good health. what appeared to be syphilitic phthisis in which im-The bacillus is always present in phthisis, and we provement followed prolonged sea voyages, and in must accept it as the full explanation of the manifest-teach case the symptoms returned when the patient ations of tuberculosis. ST. LOUIS MEDICAL SOCIETY.

Stated Meeting, April 2, 1887.

THE PRESIDENT, S. POLLAK, M.D., IN THE CHAIR. F. D. MOONEY, M.D., SECRETARY.

Dr. Charles Barck presented a specimen of ABSCESS OF THE BRAIN CONSEQUENT TO OTORRHEA.

The patient was a girl, æt. 15; she had had otorsometimes ceased altogether. For the last month tions have not been settled. she complained of headache on the left side. About three weeks ago the otorrheea was stopped suddenly state. There is no doubt that she didn't hear very at a dispensary, after which she did not go for five well in the left ear; it was in a diseased condition days; on the sixth day she had nausea, photophobia, for the past year. He did not know anything about higher fever; the seventh day she became delirious the right ear. In his opinion, and that of Dr. Breand comatose. Dr. Kay was called in. Tempera- mer, the abscess was an old one, existing probably ture was 104° or 105°. He made a diagnosis of six years. The opening into the abscess was about meningitis basilaris. The next day the ear ran as large as a penholder, and was situated opposite a some and I was called in consultation. I found pus hole just as large in the periosteum. On the posin the external auditory canal, but the walls were so terior wall, and between the two holes was a big thickened that it was not possible to get a view of the membrane. The mastoid region was swollen were more or less adhesions between the brain and and tender. I advised opening of the mastoid pro-cess. This was done on March 17. As soon as I mation of the tegmen at first, and in consequence had scraped off the periosteum we saw yellow fetid caries of the bone, and from that abscess of the brain pus escaping from the mastoid process, where there formed, and was during the last few weeks closed was a big cavity. The next day water thrown into around by the adhesions, and then gave rise to menthe mastoid came out of the canal. The fever came ingitis. It did not give rise to any brain symptoms down, the coma reduced and she began to answer during life other than the headache from time to time. short questions. The discharge of fetid pus was proopening from the outside into the mastoid antrum, way from the tympanum into the brain.

beneficial effect the operation seemed to have on the disease. Unfortunately he saw the patient too late useful operation. If he had seen the case sooner, oration of the symptoms.

accessible to any operation. The abseess was a auditory canal. very old one, probably years old, because it has what is erroneosly called a pyogenous membrane. had trephined the mastoid, three of which recovered. There is one important point that attaches to the They had gone on to mental trouble; the friends of lesion, which has not entered into the consideration one, a girl of 12 to 14 years, thought she was becom-

the left temporal lobe; that is to say, that portion of the brain where the impressions of the ear are interpreted; its psychical auditory centre, so-called. A lesion there produces deafness on the opposite side. The clinical history does not say anything about this, and certainly if the child had heard with the opposite ear there is nothing in cerebral localization. There are a few cases on record where after congenital deafness, these parts were found to be in a state of atrophy, just as there are a few cases where after congenital blindness the angular gyrus rheea about eight years. It was sometimes worse, was found to be atrophied. However, these ques-

tled Glandular and Connective Tissue Hypertropies in the Lateral Walls of the Pharynx.

DR. CHARLES H. KNIGHT, of New York, read a paper on

THE GALVANO-CAUTERY IN THE TREATMENT OF HYPERTROPHIED TONSILS.

The speaker first referred to the objections to the cutting operation. The principal of these is the danger from hæmorrhage. At times the tonsil is so deeply situated that it is not possible to get the tonsilotome over it. In other cases the patients positwo methods of using the galvano-cautery, one is by puncture and the other by the snare. The former is much the slower. Not more than three punctures should be made at each sitting. The number of sittings required vary from five to ten. The latter method with the snare is much the quicker. current should be used intermittingly and traction should only be made during the passage of the current. He did not recommend this as an universal In the majority of cases the cutting operation. operation is easier and better. It should be used almost disposed to say that the galvano-cautery should be used in all cases of adults.

Dr. A. W. MacCoy, of Philadelphia, said that in the treatment of these cases he made a distinction in the methods employed. In the glandular enlargements he had used puncture, while in the interstitial note on hypertrophies he had not used it, for in these cases you are apt to get cicatrices which give considerable trouble. He was not satisfied that the puncture is any better than chromic acid fused on a probe and passed into a crypt.

Dr. Beverly Robinson had long held that we know of no simple operation in surgery. There is nothing so unpleasant as to have to remove large tonsils from a small child. Although, as a rule, the hæmorrhage is readily controlled, yet he always un dertakes the operation with a good deal of reluctance. He was disposed to think that galvano cautery is one of the best methods. We can thus remove many tonsils that give us a good deal of apprehension.

DR. RICE said that very little can be accomplished with the cautery in the large white hypertrophies in children. The cutting operation is what must be done in these cases. In adults, however, galvanocautery is the most useful measure.

THE PRESIDENT said that he had used the cautery. but a certain amount of soreness has always followed

In children, in order to avoid the pain and pendence of laryngeal disease on nasal trouble, and nervous shock attending the cutting operation, he that the vast majority of cases of laryngitis are asso- was in the habit of etherizing the patient and remov-

SOCIETY PROCEEDINGS.

Dr. Harrison Allen remarked that while it may hæmorrhage occurs is much larger than is supposed. Dr. C. C. Rice, of New York, read a paper enti-All the disastrous cases are not reported. He was not willing to perform the operation until he had studied the case very carefully. Other measures should be first used and the knife resorted to at the last.

> Dr. D. Bryson Delavan, of New York, held that where the operation of tonsillotomy is done with proper care and with suitable styptics at hand, there is not much danger from hæmorrhage. At first there is a gush of blood, but in a few seconds this stops. He had found it very difficult to get anthentic reports of cases in which serious hæmorrhage followed this operation.

Dr. Morris J. Asch, with reference to the questively object to the cutting operation. There are tion of hæmorrhage, stated that some time ago one of his assistants removed a small section of the ton-The next day there was serious bleeding, and it was found necessary to keep up pressure on the tonsil for six hours before it was controlled.

Dr. J. Solis-Cohen thought that a great deal of the trouble in tonsillotomy is due to the adhesion of the anterior fold of the palate to the tonsil. It has been his custom to first free the tonsil from the palate. In many cases the tonsil will then go down without any treatment whatever. He thought that the hæmorrhage comes from the cutting of this fold, where there was danger of hæmorrhage, and he was for, as the vessels run in a vertical direction, they are cut obliquely. He had never been able to use the cautery with the success of the reader of the paper. In his cases it has required from twenty to fifty sit-

Dr. Beverly Robinson, of New York, read a

A FREQUENT CAUSE OF NASAL HÆMORRHAGE.

In the experience of the author the ulcerations in atrophic rhinitis had been a most frequent cause of hæmorrhage. He had found himself unable to detach the crusts from these ulcerations either by the use of douches or sprays so well as by the employment of ointments. In the course of two or three days the patient is able to blow out the crusts. best ointment for this purpose is the ammoniated mercurial of the Pharmacopæia, made with vaseline, one half full strength. After plugging the nostrils, especially in children, he has found flexible probes most useful. He has never found anything to arrest the hamorrhages so well as sheet sponge, which is cut into long strips and pushed into the nares till the bleeding stops.

> SATURDAY, MAY 28—THIRD DAY. Morning Session.

THE PRESIDENT called the Association to order,

and Dr. S. W. LANGMAID, of Boston, read a paper on

CONSTITUTIONAL CAUSES OF THROAT AFFECTIONS,

However important and interesting the morbid changes in the upper air passages may be locally, the important lesson should be learned that there are underlying constitutional causes which must be removed in order to effect a cure. Syphilis, alcoholism, rheumatism, and gout, etc., are ever at work, and their influence must be combated. Local treatment is in the nature of repair, while constitutional and hygienic treatment must be in the direction of the renewal of normal processes.

DR. GLASGOW, of St. Louis, regarded the paper as one of the most timely which had been presented to the Association. He thought the statement made by Dr. Daly, of Pittsburg, that the laryngeal physician should become a laryngeal surgeon, as one tending to do much harm, and it had done much to retard progress in this department of medicine.

Affections of the Crico-arytenoid Articulation, by Dr. George W. Major, of Montreal; Cancer of the Larynx, by Dr. Hosmer A. Johnson, of Chicago; and A Case of Recurring Laryngitis Hamorrhagica, by Dr. C. E. Bean, of St. Paul, were read by title.

Dr. Morris J. Ascii reported a case of

STENOSIS OF THE LARYNX

treated by divulsion and systematic dilatation. The opening of the larynx was diminished to one-third its normal size. The dilatation was accomplished by Schroeder's hard-rubber tubes. It was a case of hypertrophic laryngitis below the local cords, and the relief afforded by treatment had been permanent. He preferred this to any other method in this class of cases.

DR. COHEN had not had the courage to attempt to dilate without preliminary tracheotomy. He believed it was better to perform tracheotomy first, and then pursue the most active measures possible for the relief of the stenosis.

DR. KNIGHT said that Schroeder's method had been very slowly popularized in this country. He regarded it as a sub-glottic laryngitis of some kind, as had been expressed by Mackenzie, of London, and would discard the name *corditis*, etc.

DR. Morgan, of Washington, related a case in which he used dilators without permanent benefit, and in which he kept the disease in abeyance by constitutional measures and local applications. He recommended from time to time tracheotomy, to be followed by dilatation, but the patient declined, and finally died suddenly of laryngeal spasm.

DR. Delayan, believed that the method of treatment by dilatation would receive important modifications by O'Dwyer's method of intubation.

DR. Asch spoke of some theoretical objections to O'Dwyer's method for the treatment of these cases. He agreed with Dr. Knight that the term *corditis*, etc., should be abandoned. He regarded it as one of the advantages of this method that tracheotomy was avoided.

DR. D. BRYSON DELAVAN, of New York, then tendency to return. read a paper on DR. W. C. JARVE

THE ETIOLOGY OF DEFLECTIONS OF THE NASAL SEPTUM,

in which he had gathered the scattered views on the causes, which were generally admitted to be obscure. After discussing the predisposing causes, as rade and diathesis, he spoke of the exciting causes under the headings, traumatism, local malnutrition, and occlusion of the nasal passages.

DR. Morgan, had been able to trace his case to traumatism almost invariably, when the history had been carefully studied. He had seen but few cases in the African, but whether or not this was real exemption he was unable to say.

DR. DONALDSON was also of the opinion that perhaps it was less frequent in the African than among the whites.

DR. Solis-Cohen had noticed that high-arched palate and deflected septum go together in a majority of cases, perhaps; but he had also seen many cases in which there was deflected septum without high-arched palate, and also high arched palate without deflected septum. A great many children under seven years of age have deflected septum. He thought that the question of traumatism was a difficult one to settle. So also it was difficult to get at the exact influence of racial peculiarities. Over and over he had seen marked deflection of the septum without difficulty of breathing.

Dr. Sajous thought that traumatism as a cause could not be clearly defined.

DR. MACKENZIE had not seen a case of deflected septum in the African that required an operation. He regarded *traumatism* as the most prolific cause. He had also been surprised at the brilliant results said to attend some operations.

DR. DEBLOIS said that he had observed the nose of several pugilists and had been surprised to find that the septum was in the correct line, while the nose in general had been flattened and bruised with great severity and repeatedly. He thought that these cases could with propriety be regarded as traumatic.

Dr. Roe spoke of several peculiar varieties of deflected septum, and particularly objected to the use of the punch in the treatment.

Dr. INGALS had seen deflected septum in children two years of age, and he had also come to the conclusion that, unless the nasal bones were fractured or cartilages dislocated, deflection of the septum was not likely to follow traumatism.

Dr. Langmain, of Boston, reported a case of

A PIN REMOVED FROM THE LARYNX,

where it had been for two years. It was sticking through the ventricular band and pointing backward. Dr. Rufus P. Lincoln, of New York, reported a

case of

RECURRENT NASO PHARYNGEAL TUMOR,

which he had cured by electrolysis. He used a single needle, and made sixteen applications in from four to six days. The growth had not shown any tendency to return.

DR. W. C. JARVIS, of New York, reported

TWO CASES OF CONGENITAL OCCLUSION OF THE ANTE-RIOR NARES.

This is a rare condition. He had been unable to find a case recorded in medical literature, and the two reported were the only cases which he had met with in several thousand patients examined at his clinics. They were treated by means of his nasal be removed so easily with the transfixion needles. drills and electro motor. In one case the obstruction was fibrous, and in the other osseous, and the reach the posterior face of the middle turbinated bone results of treatment were very satisfactory.

AFTERNOON SESSION.

DR. ALEXANDER W. MACCOY, of Philadelphia, read a paper on

A COMPARATIVE STUDY OF SOME OF THE METHODS OF TREATMENT BEST ADAPTED TO THE RELIEF OF OCCLUSION OF THE POSTERIOR NARES

due to hypertrophy of soft parts, and not bony occlusion of the posterior nares, which he had never difficulties which had been offered in way of reaching the posterior nares, and lack of precision in mak ing applications. Since the advent of cocaine these difficulties, to a certain extent, had been overcome, but the effect produced by the drug rendered com paratively useless certain instruments which hereto snare, the use of which he had ceased, except for the removal of nasal polypi, etc. From the fact that cocaine caused such retraction of the tissues, he had not been able to make use of the needle recommended by Jarvis; but, at the same time, the drug had brought into greater use the galvano cautery and chromic acid. The chief point in the paper was to present the superior advantage offered by a concealed flexible instrument for applying fused chromic acid. He preferred this to all other methods for removing these posterior hypertrophies.

Dr. Jarvis regarded his transfixion needle as one of the most serviceable instruments he used for the removal of hypertrophied nasal tissue. He never used cocaine as a preliminary step, but first included the hypertrophy within the loop, drew the wire home, and then applied the cocaine. He regarded chromic acid as dangerous and likely to be followed by unpleasant results. He never attempted to remove a hypertrophy by means of the galvano cautery.

Dr. Rice said that it was often difficult to remove these hypertrophies. He had given up the use of the transfixion needles. There were cases in which it was difficult to apply the loop posteriorly. He had never met with the disadvantages in the use of chromic acid spoken of by Dr. Jarvis.

DR. DONALDSON favored the use of chromic acid, as did his father, who had used it without bad results for many years. As to the needles, technical skill was required for their use, and in one case he had profuse hæmorrhage following their use.

DR. DELAVAN had used chromic acid, discarded it, used it again, and had again discarded it. As for h.emorrhage, he had not seen a case where it could not be controlled readily, and he believed that, practically, there was no danger from it.

Dr. Jarvis said that an attempt to remove a posterior hypertrophy, while a deflected septum existed, was very poor surgery. First repair the deflected septum, and the hypertrophy will disappear of itself. He regarded it as triffing with the patient's nostrils to use chronic acid when the hypertrophied tissue can

Dr. MacCoy said that he had never been able to before his little instrument was invented. A single application of chromic acid was, as a rule, all that was required. In comparison with it, he regarded the use of the needle as a very difficult operation. He never uses chromic acid without immediately antagonizing it.

Dr. Jarvis remarked that the fault was not in the needle but in the operator, who failed to make the few simple manipulations necessary to its successful

Plaster-of-Paris Dressing for Fracture of the Nose, seen. He referred to different methods, and the by Dr. J. W. Robertson, of Detroit, was read by title.

Dr. DeBlois, of Boston, exhibited a plaster of-Paris splint which he had used with good result in one case of fractured nose.

Dr. Roe, of Rochester, exhibited a nasal saw which was operated by means of an electro motor.

The committee on The Congress of American Phyfore had been used satisfactorily; for instance, Jarvis' sicians and Surgeons presented its report, which was received and adopted.

The following were elected

OFFICERS FOR THE ENSUING YEAR.

President—Dr. R. P. Lincoln, of New York. Vice-Presidents-Drs. J. N. Mackenzie, of Baltimore, and S. W. Langmaid, of Boston.

Secretary and Treasurer—Dr. D. Bryson Delavan, of New York.

Librarian—Dr. T. R. French, of Brooklyn.

Council-Drs. Frank Donaldson, of Baltimore, J. Solis-Cohen, of Philadelphia, F. H. Hooper, of Boston, and E. C. Morgan, of Washington.

The following were elected Corresponding Fellows: Dr. A. Gougenheim, of Paris, and J. Moure, of Bordeaux.

Dr. A. Jacobi, of New York, was elected Honorary Fellow.

The Association then adjourned.

OBSTETRICAL SOCIETY OF PHILADELPHIA.

Stated Meeting, Thursday, April 7, 1887. THE PRESIDENT, THOMAS M. DRYSDALE, M.D., IN THE CHAIR.

(Continued from page 668.)

Dr. J. M. Baldy presented a specimen of

PYOSALPINX IN ITS RELATION TO PUERPERAL FEVER not simply because it was one of pyosalpinx, but because of its extremely important relation to the puerperal state and, as far as he is aware, because it is the first of its kind ever operated upon, and life saved when the patient was dying from, so called, puerperal fever. The patient, Mamie P., twenty-three tedious but normal labor some four years ago. She there was a free gush of pus from the tube tract and was at that time confined to her bed for eight weeks, she began to improve again from that moment. A "with an inflammation in her stomach." She how rubber tube was inserted and passed deep into the ever made a good recovery and has not suffered from pelvis and the abscess was washed out twice daily, pain or ache in her abdomen since. On February 3, The discharge gradually diminished and the tube he was called to attend her in her second labor, was again removed. The wound is now completely Although he went with the messenger he found the healed and the patient is a well woman. labor over; a dead child, together with the placentaand all the membranes intact, lay between her thighs. peral fever cases are simply cases of salpingitis sep-Her uncovered arms, chest and legs were exposed in tica is by no means a new one, and is probably held a room without a fire. FOREIGN CORRESPONDENCE

TAIT AND PEAN.

Dear Dr. Fenger:—On Sunday evening, March 27, I called at the residence of Mr. Lawson Tait in Birmingham. As dinner time was near at hand, I was invited to remain to meet some of his personal and professional friends. As I had been in training for some time to acquire the proficiency of eating two dinners in rapid succession, I readily consented to avail myself of this opportunity to meet the great haparotomist in the sanctum of his own home. Mrs. Tait is proud of the distinction her husband has attained, and takes a deep interest in his work. found it quite difficult to keep Mr. Tait in the channel of thought for discussing subjects of professional interest upon which I wished to obtain information. The evening was devoted to social pleasures and the many good things spread upon the table, and I had to submit to the inevitable. During my conversation about my prospective trip to the Continent, I was made to understand that German gynecology was not appreciated in this part of England, and that it had done little or nothing towards the advancement of modern gynecology. If I had met with such an assertion under different circumstances I should not have hesitated a moment to resent most emphatically such an insinuation, and in support of my arguments I should have quoted the results of scientific investigations and conscientious work of such men as Schreeder, Winckel, Olshausen, Hegar, Kaltenbach, Sänger and others, whose names are household words wherever modern gynecology is known and appreciated; but under the existing conditions I had to control my temper and leave the remark unchallenged.

Mr. Tait takes great interest in specimens of antiquity, and his capacious house is one great curiosity, to speak with authority, and after seeing him tie five shop. That the Tait family is childless became apparent to me by the kind attentions which were be-Staffordshire knot over the ordinary methods of tystowed upon a fine specimen of a Maltese cat. In ing, and should recommend its general adoption. my mind the sight of that cat revived the memory of During the whole operation I observed that the abthe useful purpose I had assigned to that brute in my dominal wound was kept practically closed, either researches in experimental surgery, but as I was aware that Mr. Tait entertains no kindly feelings the operator. This I observed not only in this case towards experimenters, I made no suggestions in this

with extensive patches of diptheroid membrane, a direction. It is not necessary for me to give a devery interesting condition, for it indicates the possi-scription of Mr. Tait's personal appearance, as the bility at least, that here was the point of infection, photograph I sent you some time ago speaks for itand if this is the case, this specimen at once assumes self. If you add to the large head, the long and caconsiderable importance, for he knows of only three pacious chest and still more voluminous abdomen a

The next morning at 9 o'clock found me again at These specimens may well serve to call Mr. Tait's house, as the operations were to be perattention to the possibility of infection by the admin-formed in his private hospital, which constitutes a istration of enemata, and to the importance of ob- part of his house. I was shown into a room where serving the most minute precautions as to the chem- a number of physicians had congregated. As we ical cleanliness of every instrument that may come were all strangers to each other, silence reigned suin contact with the parturient or puerperal woman. preme until we were informed by one of the nurses that everything was ready. We filed up a flight of stairs and entered one of the rooms, where we found Mr. Tait standing by the side of the anæsthetized patient in his shirt-sleeves and a rubber apron. The temperature of the room was comfortable. A female assistant administered the anaesthetic, and a young physician stood opposite Mr. Tait ready to render assistance, but it soon became evident that his presence was more ornamental than useful, as the operator appeared to require no assistance. The few instruments that I saw were kept in clean pans. The often described bag containing the sponges was hanging from a nail upon the wall, and was taken down and a few sponges thrown in a basin of warm water. The patient's abdomen had not been shaved, and was now sponged off lightly and covered with a rubber cloth with a slit in the centre. The first patient was a lady about 50 years of age, suffering from an abdominal tumor which extended a little above the umbilicus. The abdominal incision was made quickly and was about 212 inches in length. The omentum was found adherent to parietal peritoneum, and the adhesions were separated by tearing. As soon as the cyst was exposed it was tapped with the blunt fenestrated trocar devised by the operator. This instrument does not cut the tissues when it is pushed through the cyst wall, and consequently extravasation along the side of the tube does not take place, a source of trouble and danger attending the use of all trocars with a cutting edge. The pedicle of the cyst was twisted and appeared like an umbilical cord. The pedicle was transfixed with a long needle slightly curved at the end, and threaded with medium sized Chinese silk which, after the needle was withdrawn, was tied into a Staffordshire knot. The operator showed his unlimited confidence in this method of tying by dropping the pedicle at once in every instance, without examining the cut surface or separately ligating any of the visible vessels.

The immense experience Mr. Tait has had in this manner of securing the pedicle certainly entitles him pedicles I am convinced of the advantages of the with the cyst, the pedicle, a sponge or the fingers of but in all of the three cases, and to this circumstance, undoubtedly, a great share of the wonderful success

of Mr. Tait must be ascribed. The operations are operation and dressing, twelve minutes.

finger, searching for the ovaries. In this case the in- another direction. cision was a mere button-hole. We were informed. From what I glo cision was a mere button-hole. We were informed From what I gleaned from my observations in the that the removal of both ovaries and tubes would be practice of Mr. Tait, I have come to the following done for the purpose of preventing pregnancy in the conclusions: 1. He is a skilful and dexterous operfuture, as the patient had suffered greatly during and ator. 2. He depends on a diagnosis by digital exafter delivery on account of a contracted pelvis, in ploration in the majority of cases. 3. He removes cluding the formation of a vesico-vaginal fistula, the ovaries and tubes in cases for indications which uterus, and this opportunity was utilized and the ute the abdomen with numerous strips of adhesive plas. a broad tlannel roller.

moval of the ovaries and tubes in this case afforded which will add to our success in practice. abundant food for serious thought. There can be no the same object could have been reached without any 58 years of age. His face shows intelligence and danger to life by unsexing the other party?

The third operation was set for 12 o'clock. I was done, as it were, subcutaneously, thus reducing the told the evening before that this patient was probably danger from infection to a minimum, provided the suffering from a pelvic abscess, and I was exceedingly hands of the operator, the instruments and the anxious to see the operation devised by Mr. Tait for sponges are aseptic, and that this is the case in Mr. the radical cure of this often intractable affection. Tait's practice I became convinced, and his results. The abdomen was again opened by an incision only only corroborate this statement. Mr. Tait may sufficiently large to introduce two fingers. A brief not be an antiseptic surgeon, but he is certainly, in digital exploration resulted in the announcement that principles and practice, an ideal aseptic surgeon, the swelling in the pelvis was not an abscess, but a whether he is willing or unwilling to acknowledge small fibroma of the uterus. As it was claimed that such a designation. The abdominal wound was this tumor must be the cause of the recurring attacks closed with four deep sutures. A small gauze com- of pelvic inflammation, it was decided to again remove press and a thick layer of cheap cotton, with a wide the uterine appendages. One of the ovaries was adflannel bandage, constituted the dressing. Time of herent, and required more than the usual length of time for its removal. Duration of operation and As soon as the operation was completed, the visi dressing, nine minutes. The explanation of the itors were requested to retire to the same room, cause of the pelvic inflammation was new to me, as where I spent half an hour in meditation, trying to I had always entertained the idea that submucous unrayel in my own mind the mysteries which had led and interstitial myo fibromata of the uterus, even this wonderful man to such unparalleled success, when of large size, seldom give rise to inflammation when I was aroused from my dreaming condition to of the adjacent or contiguous tissues, but for the sake reality by another message that everything was ready, of the patient I hope that the interpretation of the The little crowd of seekers for knowledge were led case was correct, and that the operation will be the into another room, where we could hardly find time means of preventing future attacks, as the patient to arrange ourselves around the table when Mr. Tait who has lost one of her most important organs is was already in the abdomen with his bulky index certainly entitled to an equivalent of happiness in

which, however, had been cured by operation. Both few gynecologists would be willing to accept as justiovaries and tubes were removed. It was also stated fiable for such a serious procedure. His wonderful that the patient was suffering from prolapse of the success may be attributed to: 1, aseptic surgery; 2, small incisions; 3, no unnecessary exposure of perirus was stitched to the inner surface of the abdom toneal cavity; 4, perfect familiarity with pelvic and inal wound after both tubes and ovaries had been abdominal surgery as far as the mechanical performremoved. The whole operation, including the dress- ance of operations is concerned; 5, rapid operating; ing, occupied only seven minutes. If forgot to men- 6, careful personal supervision in the after-treatment. tion before that the dressing is first fastened upon There can be no question that much of his success also depends on the fact that he performs his operater which overlay each other, and embrace about two-litions almost without assistance, and in this respect thirds of the circumference of the body, over which all laparotomists should lose no time in imitating his another cotton compress is applied, and retained with example. With all his faults, Mr. Lawson Tait has done much towards the advancement of gynecology, To me the indications which had led to the re- and we may learn from him many a valuable lesson

I arrived in Paris via London, Dover and Calais, question in my own mind, and in the mind of any! March 29. My principal object in visiting Paris was one who has the well being and happiness of his to see some of the abdominal work of Pean. In the fellow-beings at heart, that it was not desirable that evening I called at his residence, but failed to see this woman should again be exposed to the dangers him, as he had gone out to make his evening visit. of another pregnancy, but as a practical American it. In the absence of her husband Mrs. Péan kindly inoccurred to me that it would have been wiser to re-vited me to attend his operations next morning at the sort to the less hazardous procedure of unsexing her Hôpital, rue de Sarlé, where most of his abdominal husband, which would have certainly secured the operations are performed. The next morning at 9 same immunity at a minimum risk to life, and morally o'clock I met him at the hospital, and was fortunate would have been more justifiable. This poor creat chough to see him perform two of the most difficult ture had suffered untold agonies, and why submit her operations in surgery during the forenoon. Péan is to such a serious operation to procure sterility, when a large man, with black hair and side whiskers, and is man of superior knowledge and great courage. As posed of many portions, was removed in large slices soon as I entered the operating room my attention with a large amputating knife, and whenever hemorwas attracted by the display of numerous instru-rhage occurred it was at once arrested by applying ments; the number of large and small hamostatic the large compression forceps. At times at least forceps could not be counted, but there must have twenty four forceps could be counted in the abdobeen at least more than a hundred. Usually he has men. When the base of the tumor was reached the four assistants. The operator wore a fur-lined vest bladder came into view in front, and injury to its and rubber apron. The operating room is quite walls was carefully avoided by ascertaining its exact small, and was not specially heated for the opera position by means of a catheter. In tying the short tions. Chloroform is used exclusively as an anest pedicle, composed of the uterus itself, a large, blunt, thetic. Only five visitors were present at this oper-curved needle, mounted on a handle, was passed on ation, which gave us a good opportunity to follow each side of the uterine canal, and the double ligaevery step.

age, who had been suffering for many years from a side was tied with one of the ligatures which secured myo fibroma of the uterus which at present reached the large vessels on each side of the uterus, and the above the umbilicus. Shaving and disinfection with central portion was secured by tying two of the liga-a sublimated solution (1-1000) was done by Péan tures in front and behind. The remnants of the himself after the patient was under the influence of tumor above the ligatures were carefully dissected the amesthetic. During the operation the sponges out, the mucous membrane of the uterine canal exare in the hands of two sisters; one of them washes cised and the canal closed with deep silk sntures, all them in warm water, while the other wrings them out visible vessels were carefully tied with catgut, the surof a r-1000 solution of corrosive sublimate and hands face cleansed, closed and dusted lightly with iodothem to the operator or one of his assistants. After the patient was under the influence tween the patient's legs, a position which certainly of the anaesthetic the parts were disinfected, and the offers great advantages in operations upon the uterus operation made with the patient in the exaggerated which are necessarily prolonged. After the elastic lithotomy position. The vagina was distended with vulsellum forceps. The circular incision, through the chitis, consumption of lungs, and tonsilitis decreased round and broad ligaments were secured with forceps. After the uterus was removed, almost without the loss of a drop of blood, about twenty forceps occupied the vagina, and were allowed to remain. A few small pieces of sponge, secured with a string and dusted with iodoform, were introduced along with the forceps. The forceps are allowed to remain for twenty four hours, when they are removed. It is said that secondary hæmorrhage never was observed after performing vaginal hysterectomy in this man-The operation lasted an hour.

The next day I had an opportunity to see another supravaginal hysterectomy at the same place. The tumor reached to the ensiform cartilage and displaced the viscera in an upward direction. The patient was about 40 years of age, and had become quite anæmic from repeated losses of blood. The tumor was irregular in contour and presented a nodulated surface, owing to numerous small subserous myofibromata. The abdominal incision in this case extended the whole length of the linea alba, and the tumor was difficult LIST of Changes in the stations and duties of officers serving in the medical department, u. s. army, from June 4, 1887, to ment. Copious hæmorrhage took place from the punctures, which was promptly arrested by compression with sponges. The remaining steps of the operation were the same as in the first case, and the time Major B. E. Fryer, Surgeon, granted sick leave for one month. S. O. 23, current service Div. Pacific, amended by S. O. 29,

Péan is an untiring worker. Endowed with a vigorous body and an active brain, he finds no pleasure in rest. His voluminous works testify to his zeal and fertility as a writer, and the clinical material they embody shows an amount of personal experience seldom acquired by a man of his age. I was informed that frequently he performs from six to seven operations during a forenoon at the Hôpital St. Louis. Perhaps one of the best evidences of the high esteem in which he is held in the hospitals with which he is connected, is that his aged assistants submit humbly to his frequent and noisy scoldings, and that he is permitted to swear, and swear as only a Frenchman can, in the presence of the sisters, who evidently fail to appreciate that part of the performance, and who lose no time to do all they can by way of repair in silent prayer. Yery sincerely your friend,

MISCELLANEOUS.

HEALTH IN MICHIGAN.—For the month of May, 1887, compared with the preceding month, the reports indicate that the cholera morbus increased, and that pneumonia, influenza, rheumatism, bron-1

mucous membrane, was made with a scalpel, and the in prevalence. Compared with the preceding tissues around the uterus seized step by step with month, the temperature in the month of May was compression forceps, and the dissection made with much higher, the absolute humidity was much more, scissors, fingers and blunt instruments, almost blood- the relative humidity was about the same, the day lessly. tice, I shall no doubt clash with some of you. Let it not then be understood that, however earnest I may be in stating my convictions, I regard or ask matters of practice; and if I state too strongly any dogmatism of intolerance that causes me to speak forcibly.

Patients and surgeons are not the same from day wise man, is to make mistakes—only fools are per-

following rules.

It is not to the rare and brilliant procedures of surgery to which I invite your attention; but rather to the common and frequent diseases. I shall endeavor to discuss two subjects that are now under going the test of experience. These subjects are alike important to the physician and to the surgeon.

I ask your attention first to Tracheotomy and Intubation for Diphtheria and Croup, and then to the

subject of *Peritonitis*.

TRACHEOTOMY AND INTUBATION.

The question of Tracheotomy or Intubation has been on trial and I think progress has been made in the treatment of the laryngeal stenosis, which so frequently accompanies diphtheria and croup. The progive prompt and early relief to the obstruction, rather than in the introduction or revival of intubathere were 12 recoveries. tion. Diphtheria and croup are always with us, and are so destructive to life that many physicians assert, the one that diphtheria, the other that croup never gets well, and that operative interference is of no avail. Yet patients recover from either or both diswaits for nature to relieve it from the larvingeal ob- date. struction. The history of laryngeal diphtheria, is that enough to demand relief on the fourth or sixth day; otomies with 46 recoveries. and failing to obtain this relief, soon ends life. I can mate of the virulence of the diseases which produce, the fact that the class of cases offered to the opera-

gaged did not contribute to scientific facts to other laryngeal stenosis; but I can not find any excuse for departments of knowledge. Surgeons not content one who will permit a child to die from mechanical with applying knowledge gained from other fields, obstruction, no matter what disease originated it, or

Some of you may think it unnecessary to dwell on their work, truly scientific facts to the sciences of bi- this point; but I am sure there are many here who ology, bacteriology, physiology, pathology, and even have seen children die from this obstruction, before anatomy. Scientific practice stands as an entity, the disease producing it terminated life. Tracheotonly is not a pleasant operation, and many shrink Many surgical diseases which have long been with from it; it is performed for a disease progressive and us receive routine treatment, which it is becoming fatal in its tendency. The results are not brilliant, and there is nothing to induce the surgeon to urge called advances of the year which must be accepted the operation, except humanity and the positive knowledge that lives are thus saved. Statistics are judgment is all powerful with us yet, and practice is not always reliable, and especially will they vary from year to year in the mortality of different epi-Hence in stating my view to day of points in prac- demics of diphtheria. Nevertheless, I venture to present some statistics taken from the records of our private office, for I think they illustrate and demonstrate an important point which I wish to emphasize. you to accept as final, any expression of mine on It is, however, possible that the great improvement in the results of the last few years have been due to point, it is the earnestness of conviction, and not the the fact that the patients have very generally been subjected to repeated doses of corrosive sublimate by the attending physician before it was necessary to operate. Some practitioners assert that the surgeon to day. It has been well said, "The privileges of a has been displaced by the use of corrosive sublimate. I believe, however, that all who consider the circumfect, (perfect fools)." The dull and stupid surgeon stances under which these statistics were collected is the only one who is satisfied, and is surely right in will admit that the gradual improvement is due to the fact that the operation during the later years was not withheld from the patient until such changes were induced by the long continued obstruction as to lead to fatal results, without reference to the primary disease.

I was associated for many years with the late Dr. John T. Hodgen, who was one of the staunchest advocates of tracheotomy. The records of our office for the past thirty years show 170 cases of tracheotomy for diphtheria and croup, with 46 recoveries, or a percentage of 26.9. The record of the operations by Dr. J. T. Hodgen begins in 1856, and ends in March, 1882. He made 14 consecutive operations without a recovery in the early part of its trial. In the period ending March, 1877, he had made 70 operations with 9 recoveries. During the gress of the past year or two in the solution of this last five years of his life, ending in 1882, he made 21 very difficult problem is shown in the disposition to operations with 6 recoveries. My record begins in 1872, and with the close of 1883, out of 42 cases

1884—4 cases; 1 recovery.

1885—3 cases; 2 recoveries.

1886—22 cases; 11 recoveries.

1887—3 cases; 2 recoveries.

And from January, 1884, to date, 32 cases with 16 eases. Culpable is the man who recognizes this fact recoveries; or a total of 28 recoveries out of 74 and stands at the bedside of the little sufferer and cases, beginning in 1872 and ending with present

My brother, Dr. Harvey G. Mudd, has had 6 cases the obstruction is progressive, and becomes severe with 3 recoveries. This makes a total of 171 trache-

The first group of symptoms is urgent in its applied, and the muscular power greater, than where demands for relief; the latter does not demand oper- such a process has advanced down the trachea and ative interference, for the conditions cannot be so re- into the bronchi. (Vol. iv, Handbook of Medical

The long tube, I believe, gives an opportunity to say of a given case, "It is hopeless," for recoveries start expulsion by bending the neck, thus loosening from the most desperate conditions sometimes follow it from the larynx. The limited motions of the cord, There are many conditions when the the infiltration of the tissues of the larynx, and the surgeon may stand by and watch for the progress of paralysis of the muscles occasionally demand a long the case to relieve him of the need for operation; continued use of the tube which is incompatible with but laryngeal stenosis is not one of them, and no the life of the patient, since deglutition and nutrition

Tracheotomy, on the other hand, rarely interferes Tracheotomy is, in my opinion, the better, the with the nutrition of the patient. Fluids as well as safer operation, and I believe time will attest its solids are taken readily when other symptoms permit, value as a therapeutic measure, and make clearer its and the nutrition of the patient, the most important importance to the profession and the public. The element in the treatment of diphtheria, is not dislast resort—yet the percentage of recoveries is more trachea tube is larger and favors the expulsion of membrane, and if, in expulsive effort, it should be-My experience with intubation has not been very come blocked, any nurse, no matter how ignorant, be maintained through the larynx or tracheal wound chiefly with a view of preventing the spread of the the operation if the obstruction is marked.

increase of the residual air, and the consequent congestion of the mucous surface, with its attendant pronchial effusion and catarrhal pneumonia, will not then add to the gravity of the case.

The apparent results of tracheotomy would, I be lieve, be vastly improved if it were applied to such tions with intubation promises better results, because: cases as I suspect have been utilized for intubation. Yet I wish to emphasize the fact that tracheotomy and nutrition. should not be made until there is a marked recession of the supra- and sub-sternal tissues during inspira- | desired. tion, followed by a forced expiratory effort. This muscular effort is incompatible with very rapid res become plugged with membrane. piration; but it indicates a local, usually laryngeal obstruction to the respiratory movements. rapid respiratory movements which are found in children suffering from pneumonia, from capillary bronchitis, and from the deposit of diphtheritic or croupous membrane in the bronchi, is very different, though often mistaken for that slower but more labored respiration of local obstruction. Occasionally the two conditions are combined and the differential death by chloroform, narcosis, or from suffocation, diagnosis is impossible.

I think Dr. F. E. Waxham has improved the gag of Dr. O'Dwyer, and improvements in the instruments used in intubation may render it still more useful; but as yet it cannot compete with trache otomy where there is need for operative interference. Tracheotomy gives fresh air to the lungs, and if care be taken to moisten and warm this air, there is practically little danger of serious bronchitis or pneumonia, and there is less danger of the extension of the membrane downward, than if the respired air first passed over the foul and diseased month and pharynx. This, I believe, is no small factor in favor of tracheotomy. Again, after trache ria as soon as it is certain that the larynx is affected, cult position.

until the surgeon is called. The operation is not so disease downward." There may be some reason in easily performed as intubation; but it is not more the rule; but there are many reasons why I do not dangerous, and should be accomplished in from five favor its recognition. Nor do I believe in our abilto twenty minutes. I do not know of any more try- ity to control the extension of the membrane by ing or disagreeable operation than tracheotomy when antiseptic solutions and forcible cleansing of the the demand for relief is urgent; but I firmly believe surface involved, as advocated by Mr. Cheyne. Certhat it offers a better chance for curative influence tain it is, however, that it is rare to have the memthan intubation. When a surgeon skilled in the brane extend down the trachea, unless it has already operation is not at hand, no one should shrink from invaded it at the time of the trachcotomy. In this connection it may be well to consider another sug-In estimating the value of tracheotomy in diphthe- gestion made by the same author, that is, "the utility ria, I hope all will remember that it is performed for of packing the epiglottic space above the tracheal one of the most fatal and desperate of diseases, and opening with an antiseptic plug." PERLIONITIS.

The subject of peritonitis with Laparotomy, prophylactic or curative is just now of vast importance. The magnitude of the subject and the mass of literature already accumulated preclude the possibility of fully considering the one, or of reviewing the other. Yet, I believe it will not be unprofitable to consider briefly what seem to be, in the absence of well established rules, justifiable procedures in the treatment of peritonitis.

Laparotomy is urged for gun shot wounds, stabs, contusions, ruptures and ulcerations, where it is supposed that visceral involvement has made possible the escape of fecal matter. The most difficult matter here to be considered is diagnosis. Are the diagnostic signs of such visceral effusion as may be expected to accompany shot wounds, stab or rupture promptly manifested and clear in their character? The shock of a penetrating wound varies not only with the amount of the injury inflicted, but with the individual and may delay distinct evidence of visceral, injury until a peritonitis fatal in the shock attending its onset closes the scene. Positive signs of perforation will in many cases be absent, and we must make our operation one of exploration, or else await the development of the case. In the absence of clinical signs, positively indicating visceral lesion, must we promptly resort to exploratory laparotomy in all cases of gun shot wounds?

I take the gun-shot wound as a typical one, apt to produce visceral lesion with effusion, and because there is greatest need for improvement in the therapentic measures in this class of injuries. The answer to this question must be guarded, for a categorical one would but poorly express the sentiment of the profession of to-day. We may first exlude such cases as are accompanied by profound shock, evidenced by lowered temperature and loss of general vital power, since the minute examination of the abdominal viscera necessary to repair such injuries is likely to intensify the shock and hasten an unfavorable result. Again, it cannot be successfully denied that cases recover after visceral laceration by bullet wounds without operative interference. These recoveries are more apt to follow where the ball is small, and the intestinal canal is comparatively empty. The proportion of these spontaneous recoveries is as yet unknown; but they are, I believe, sufficient to justify non-interference in penetrating wounds inflicted with a small ball, where urgent symptoms due to the escape of visceral contents, are not present. There remain, then, for exploratory laparotomy, cases in which shock is not too great or where it is transient, and followed by pain, anxiety, tympanitis and other symptoms indicative of visceral injury. Theoretically, the exploratory operation is correct and should be applied to every case of bullet wound since perforation is expected in all; but in practice there are many obstacles, and it is questionable how great an improvement in results obtained will follow the enforcement of this therapeutic meas ure. The average result attending the expectant treatment is bad, yet it must be remembered that the injury is severe.

Laparotomy as a therapeutic measure is one about which surgeons are anxious, and which they guard with every precaution against untoward results, although laparotomy performed on an uninflamed peritoneum is not considered a dangerous operation, and is usually innocent of harm. In estimating the absolute need for operative interference it should be remembered that all perforating visceral wounds do not permit the escape of visceral contents into the peritoneal cavity, and that small quantities may be absorbed or encapsulated, and the consequent inflammation be limited and a cure established. On the other hand, it is known that an acupuncture may excite peritonitis, that a bullet wound is prone to ulcerate at its exposed surface, that a break or rupture in the peritoneal surface which communicates with a connective tissue space or a visceral cavity is a focus for a diffuse peritonitis, while a smooth well approximated wound in which the peritoneal surfaces are in contact, readily heals.

If the severe shock of a great injury merges into a violent peritonitis, or the milder cases where diagnostic signs have been absent develop a diffuse inflammatory process, what are we to do? The peritonitis, diffuse and violent may develop without the escape of visceral contents, and the patient recover. Peritonitis following the escape of the visceral contents is almost certainly fatal. A laparotomy performed in the presence of peritonitis is certainly injurious and without any benefit unless we can remove septic fluids, drain purulent pockets, repair leaking rents in the viscera, or cut off from the peritoneal cavity infecting pockets by approximating serous surfaces. Diagnosis is here again deficient, and we are unable to determine the necessity for operative interference, the operation is again exploratory, except where the septic serous effusion is large or the peritonitis is circumscribed and purulent pockets are perceptible. Here the demand is unequivocal and clear and is not to be ignored. The well-founded general laws of surgery give warrant for this laparotomy and no exceptions are admitted where the vitality of the patient is not exhausted and death iminent. General loss of vital power threatening death, or grave functional disturbance, or the known presence of visceral contents in the cavity are urgent demands for operative interference, notwithstanding the presence of peritonitis. The laparotomy will be curative in its influence if visceral lesions are repaired, antiseptic cleansing thoroughly established, and good drainage effected. If the peritonitis is slow in its development and the diagnosis is uncertain, there is a wide diversity of opinion as to the method to be pursued. Operative interference is pernicious, and a toilet of the peritoneum is of no avail as a therapeutic measure unless septic fluid is removed or lacerations repaired.

Surgeons of wide experience do not interfere as long as there is a possibility of a spontaneous cure; others advise the operation as soon as peritonitis is evident

The difficulty with most surgeons will be in the fact, that it is impossible to determine that conditions are present which demand interference and

the peritoneal cavity.

Laparotomy is not demanded in the presence of peritonitis except where septic fluid is abundant, a purulent collection is evident, a general loss of vital power threatens death, or where there is grave functional disturbance.

These deductions are not so radical as many would like but they are less conservative than many practice, and 1 believe they fairly represent the podetermine. present guide me in the management of such cases, exceptions. and are the deductions made from a limited experibearing upon the subject.

Trustees of THE JOURNAL, read the

REPORT OF THE TRUSTEES OF THE JOURNAL including in it the report of the Editor, as follows:

The Board of Trustees for publishing THE JOURNAL. OF THE AMERICAN MEDICAL ASSOCIATION respectfully submit their annual report for the year ending Trustees, Dr. N. S. Davis consented to continue the active management of THE JOURNAL in both its ediof its issue has been unbroken. The practical operation of The Journal's own printing office has been more gratifying during the past year, as will appear from the editor's report. Gradually we may expect this office to enlarge its already valuable service to Association who are able will visit it at 68 Wabash avenue.

The report of Dr. Davis to the Board of Trustees is so full in all details that we submit it with our report, as follows:

Annual Report of the Editor of the Journal of the American Medical Association for the Financial Year Ending March 31, 1887; Made to the Board of Trustees April 15, 1887.

To J. M. Toner, M.D., President of the Board: In accordance with your rules I respectfully submit the following report concerning the progress and financial condition of THE JOURNAL of the Associa tion during the year ending March 3t, 1887, at this printing office at date of this report \$1,058.56; on

Dr. G. H. Rohé, of Maryland, moved to amend the 'early period, that the members of your Board may title to be the Section on Dermatology and Syphil- have more time to consider its contents, and be better ography. This was accepted by the original mover prepared to submit their own report at the next meeting of the Association.

Weekly Circulation.—At the date of this report, March 31, 1887, the total regular weekly circulation of THE JOURNAL was 4,387, of which 3,478 are sent to members of the Association whose names are furnished by the Treasurer, and 909 are furnished to After the various delegations had been requested regular subscribers and exchanges. This shows a net increase in the membership of 104 and in the total weekly circulation of 116, since my annual re-Committee, the Association on motion adjourned, to port for March 31, 1886. The number of copies of THE JOURNAL printed each week during the past year has been 4,800, an increase of 300 over the number printed each week for the preceding year. Although the excess printed has been 413 more than required THE PRESIDENT called the Association to order for the regular weekly mail list, yet the number required to supply extra copies to contributors, to complete files for members, and sample copies when called for, is such that we have not more than about 200

Receipts.—The receipts at the office of publication relate only to money received from subscribers, advertisements, reprints and extra JOURNALS; all mempresented several invitations, which were accepted, bership dues being paid to the Treasurer of the By permission, Dr. N. S. Davis gave notice that Association and accounted for by him in his annual report. From the sources just named there has been received at this office during the year ending March 31, 1887, the sum of \$7,580.63; of which \$2.494.09 was from subscribers, \$751.35 for reprints, and \$4,-DR. J. M. TONER, President of the Board of 335.19 for advertisements; making an increase from these sources of \$2,250.17 over the receipts from the

same sources the preceding year. Expenses.—The total cost of publishing THE JOUR-NAL, 4,800 copies each week, and such reprints as have been ordered by contributors, for the year ending March 31, 1887, is \$13,162.01, of which \$751.35 was for reprints, making the cost of the publication March 31, 1887. At the earnest request of the of The Journal alone \$12,410.66; an increase of \$1,426.99 over the cost of publication of the preceding year. This additional cost is fully accounted torial and publishing details. The uniform regularity for by the 300 more copies of THE JOURNAL and from eight to ten more pages of advertisements each week, than was published the preceding year; and is considerably more than balanced by the increased receipts at the office of publication as shown in the preceding paragraph. The total amount drawn from the Association. It is hoped that all members of the the Treasury for editorial expenses, including foreign and domestic correspondence, reports of proceedings of medical societies, clinical lectures, etc., and the salary of an Assistant Editor in the office, during the year ending March 31, 1887, is \$2,758.95; making the total cost of THE JOURNAL of the Association for the year ending March 31, 1887. \$15,920.96. And the total receipts from all sources, as will be shown by the annual report of the Treasurer, \$21,723.22.

Property on Hand.—The cash value of the type, fixtures, etc., belonging to the Association printing office as established last year, after deducting 15 per cent. for wear, is \$921.34, to which has been added new type, etc., as needed during the present year, costing \$137.22, making total cash value of the

which we have a policy of insurance for \$800. (The until after the annual meeting of the Association in sum of \$137.22 paid for new type is included in the May last, and many of those engaged in it had withaggregate publication expenses given in a preceding drawn either by direct request or by refusal to pay paragraph.) Some of the numbers belonging to each their dues. On motion of Dr. Wm. Brodie the report was accepted and adopted.

Dr. N. S. Davis then read the

REPORT OF THE SPECIAL COMMITTEE ON CHANGES IN THE PLAN OF ORGANIZATION AND BY-LAWS OF THE ASSOCIATION,

appointed in accordance with the following resolution adopted by the Association at the last Annual Meeting:

Resolved, That a committee of nine members, including the President, President-elect, and the four Vice-Presidents elect, be appointed by the Chair to consider the various propositions looking to the amendment of the organic law of the Association by the establishment of Branches, or in any other way; said committee to report at the staxt annual meeting what measures of organization, if any, may be desirable.

shows that the adoption of this resolution was in-tion to that of the British Medical Association, by spired by two leading considerations: First, the de- which it was claimed that a much larger proportion sirability of a more permanent and representative of the profession could be included in the memberbusiness committee to perform the duties now de-ship nominally, while the whole business managevolving upon the Committee on Nominations, and ment could be confided to a Council of limited to consider all other questions of importance that number. A large part of the criticisms hitherto may be referred to it by a vote of the Association, made, have obviously emanated from parties who and report upon the sume at such time as the vote of have but a limited knowledge of the history of volreference shall direct. Second, the desirability of untary medical organizations and of the practical increasing the paying perminent membership, that working of the principles necessarily involved. Still the annual revenue may be increased. Perhaps no less have they studied the influence of density or other part of the practical working of the Association spareity of populations, national habits, modes of has occasioned so much adverse criticism as the hasty thought, civil institutions and municipal divisions, and imperfect method of selecting, after the com- on the success or failure of voluntary professional mencement of each annual meeting, of the Commitorganizations in any given country. Yet all of these tee on Nominations by such little groups of delegates have their influence, and need to be carefully studied from each State and Territory, as could be gathered by all who would successfully shape the permanent in some corner of the room in the brief recess of social automony of any profession or class of people. fifteen minutes, and on whom devolved the para. For instance, the members of the medical profession mount duty of nominating all the general officers of of Great Britain, numbering little more than 25,000, the Association, of seven members of the Judicial constituting a part of an enlightened people occupy-Council, three members of the Board of Trustees, ing the British Islands, a territory scarcely equal to and the selection of the next place of annual meet- the six New England States or to the single State of ing; duties that the members are generally required. This they have been commondations. Besides the absence of any perma-(5) In common with nent committee during the interim between the annual For instance, Literally they lie on the table, receiving are not present, to explain their practical bearing either for good or evil.

The desirability of having more time and deliberation given to the purely business matters of the Association by a properly organized Council or standing committee on business, has long been recognized by all the more experienced members of the Association; and various plans have been suggested from time to time without leading to any definite action. For several months prior to the last annual meeting of the Association, those who were more particularly influenced by the desire to obtain a large revenue, suggested and actively discussed the practicability of so changing the plan of organization as to admit the formation of Branches whose members should be also permanent members of the Association, amenable to the payment of membership dues, and thereby entitled to The Journal. These suggestions Familiarity with the history of this Association had for their object the assimilation of our organiza-|accustomed to look to one central imperial govern-A committee thus hastily appointed, compelled to ment, naturally, and probably judiciously, adopted

a national organization founded on the idea of mak-tion, where all the circumstances have been most ing it possible for all the legally qualified members favorable, has been to put the entire control of the of the profession to become members. For this affairs of the Association in the hands of those mempurpose, such rules were adopted that the members bers of the Council in London and in the few imof the profession in any part of the country could portant cities affording most ready access thereto, associate together to constitute a Branch Associa and thereby to create much jealousy and dissatisfaction or not less than a specified number, and by contion in some quarters and great indifference in other forming to the general rules prescribed and paying places, it requires but a moment of serious reflection the annual membership fee, they became members upon the extent of our country, its division into of the National organization, entitled to attend the nearly forty States, each legislating independently annual meetings and receive the British Medical on all matters of education and professional regula-Journal. Committee.

Dr. Albert L. Gihon, U. S. N., the remaining member of the Committee was not present at the conference when the report was adopted.

Dr. R. C. Early, of Penna., moved that the report be accepted and the Committee discharged.

Dr. A. S. von Mansfelde, of Neb., moved that the report be adopted. The motion was adopted.

Some discussion having arisen relative to the matter, Dr. Eugene Grissom, of N. C., arose to a point of order, that this action was final and hence the changes proposed by the Committee did not lie over.

The Chair decided that this was correct, and that changes recommended by the Committee had been adopted.

Some further discussion having arisen, Dr. A. N. Bell, of N. Y., offered the following:

Kesolved, As the sense of this Association, the question has already conformed to the Constitution, having been before it one

A call of the house having been demanded, a vote standing was taken, resulting in 272 in the affirmative and 232 in the negative.

A motion to reconsider the vote was, on motion of

Dr. E. Grissom, laid upon the table.

States and announced the following as the

COMMITTEE ON NOMINATIONS.

Ma., W. C. Cross; Ark., D. C. Ewing; Cal., J. W. Robertson; Col., P. Brumund; Conn., W. H. Whitvey; Iowa, Wm. Watson; Ks., W. L. Schenck; Ky., D. S. Reynolds; La., T. G. Richardson; Me., D. E. tical Association was presented, enclosing the following:

Resolved, That this Association solicit the aid and coopera-

lished formulas in preference to others.

On motion, the resolution was adopted.

Dr. J. S. Lynch, of Baltimore, Chairman of the

ADDRESS IN MEDICINE.

On motion, it was referred for publication.

On motion, the Association adjourned until Thursday at 10 A.M.

THURSDAY, JUNE 9-THIRD DAY.

The President called the Association to order at 10 A.M., and prayer was offered by Rev. J. H. Barrows, D.D.

The Committee of Arrangements announced a number of invitations, etc. Two charges against members, of an ethical character, were presented, and referred to the Judicial Council.

A congratulatory telegram was read by the Permanent Secretary, from the Ontario Medical Association, then in session. On motion of Dr. William Brodie, it was received, and the President was requested to send a response. His reply was: "The President and members of the American Medical Association acknowledge the friendly greeting of the Ontario Medical Association, and desire to convey to them their feelings of sympathy and good fellowship."

Dr. Brodie, as Chairman of the Committee on Nominations, reported the following

George H. Roné, Secretary Rush Monument Committee.

tory and purpose of the project and shows the emi- the bank book of deposits, and all vouchers for explacing a statue at the National Capital to honor the such action as the Association may deem proper to foremost medical man that our country has produced. take. This view which had become quite general found expression in the appointment of a standing committee, amounts to \$389. by the American Medical Association, at its meeting in 1885, charging it with the special duty of raising bered from 1 to 8, inclusive, amounts to \$143.08. funds and erecting in Washington city a suitable monument to Dr. Benjamin Rush, whose learning, as the printing of blanks will serve for a year or professional eminence and patriotic services easily more. It is possible that the amount received by the place him at the head of the many worthies of our treasurer may be less than the Association and the noble profession in America.

represent the universal esteem in which the memory has just begun work, and that this report embraces of Dr. Rush is held by the medical profession every-returns from but about one half the States and but where, it was deemed advisable to invite the medical partial returns from any. men in every State and Territory of the United States to aid, by small contributions, in this testimonial.

Dr. Rohé, in his report, which I have also seen, shows how through the agency of a member of this committee resident in each State and Territory, the Army, Navy, and Marine Hospital Service, the profession has been everywhere solicited to join in this Tuke: work. Responses making partial returns to the treas urer from the members of the committee in the following States have been received: Arkansas, California, Colorado, Connecticut, Indiana, Kansas, Maryland. New Hampshire, New Jersey, New Mexico, New York, Ohio, Pennsylvania, Vermont, West Virginia, U. S. Army, U. S. Navy and U. S. Marine Hospital Service. The States and Territories not named have not made returns to this date, June 2, 1887, although some of them, we hear, are at work in the matter. The information received from the members of the committee in the several States is to the effect that the project meets the hearty approbation of the medical men of their section, and that contributions will in time become so general as practically to include every physician of note in the country.

To the end that the profession may know with what degree of prudence the money raised for the Rush Monument is being husbanded, I deem it proper to refer briefly to the rules adopted by the committee when it organized for business, touching this important matter. They require that the names of all contributors, with the amounts given, shall be entered in a book kept for the purpose, and that a receipt, or certificate, for the same, signed by the treasurer, be

transmitted to the donor.

That all moneys received shall be deposited by the treasurer in the bank of Riggs & Co., in Washington, to the credit of the Rush Monument Committee.

That no debts shall be contracted by individual members of the committee, not authorized by a vote of the committee, except the necessary expenses of postage and printing, and these must have the con-Report of Treasurer.—The treasurer of the Rush current sanction of the President, Secretary and Monument Committee begs leave to submit, this, his Treasurer. Dr. Jno. Morris, of Maryland, on behalf of Dr. Jas. M. Keller, Chairman of the Committee, read the

REPORT ON CREMATION

as follows:

The Committee on Cremation, appointed at the last

That no facts of a practical character, in addition to those so forcibly presented by the former Committee, Johnson, of Missouri, Chairman of the Section. have come to their notice during the year. A report made to the American Public Health Association at Toronto, last October, largely embodies the views of the Committee. In that report it is stated that it is only in the case of sudden and violent eruptions of disease or a great epidemic that the failure of the ordinary modes of burial can be realized or properly brought to the notice of the people. That as long as such outbreaks do not occur, no particular attention is given to the matter by the profession or the larty; treasury of the Association during the interval bethat inasmuch as cremation has not met with popular acceptance, a modified form of cremation, called by Liebig cremacaucus, might be adopted. This 319.45, leaving a balance in the treasury at this time looks to the adoption of municipal and State laws, compelling the use of destructive agents to bring about the rapid disintegration of the dead body. spectfully submitted. Caustic lime or chloride of zinc are especially fitted for this office. This process of immediate destruction of the dead body is particularly desirable in cases of persons dying of zymotic diseases. The asked an appropriation of \$10 to the Index Mediburial of persons dying by these diseases should be cus. On motion, this was granted. placed by law in the hands of the health authorities. The old fashioned triple coffin and vault should be of the Committee on Finance of the Ninth Internaentirely discarded. Earth to-earth burial should, as tional Medical Congress, asking aid. far as possible, be encouraged. As our cities increase, as our populations thicken, the evils of our ment was offered to make it \$1,000. This was adopted. present mode of burial will increase. In the end it will be discovered that cremation is the purest, safest means of escape from the evils incident to decomposition of the dead.

The report closed with the following resolution:

Resolved, That it is the judgment of the American Medical Association that the burial of all persons dying of zymotic diseases should be placed by law under the control of the health. authorities, and that in all such cases of disease chemical agents should be used by such authorities to bring about a rapid disintegration of the dead body.

The report was referred to the Section on State Medicine at the request of the special committee.

Dr. J. McF. Gaston, of Georgia, Chairman of the Special Committee on the

PREVENTION OF VELLOW FEVER BY INOCULATION,

offered the following:

WHEREAS, An appropriation has been made by Congress for investigating yellow fever inoculation, and an eminent bacteriologist has been appointed to examine the data presented in Mexico and Brazil,

Resolved, That it is desirable that two other members of the medical profession should be associated in this work, one having practical and clinical acquaintance with yellow fever, and the other being qualified to communicate with the population of the respective localities:

Resolved. That a committee of three be appointed by the President of this Association to communicate this action to President Cleveland, setting forth the grounds for such recom-

A motion by Dr. G. H. Rohé to lay it on the table was lost, and the resolutions were adopted. Rohé moved a reconsideration, which was lost.

On motion of Dr. N. S. Davis, it was agreed to of declination or death, to fill the vacancy. proceed with the regular order, as the By laws require that new and miscellaneous business of this Hospital Service at Washington, offered the followkind should be considered only on the first and fourth ing resolution, in relation to the investigation of the days of the session.

The Address in Obstetrics was read by Dr. F. M.

The Address in State Medicine was read by Dr. G. H. Rohé, of Maryland, Chairman of the Section.

The Address on Diseases of Children was read by Dr. J. S. Knox, of Illinois, Chairman of the Section. These addresses were referred for publication.

The Permanent Secretary read the

REPORT OF THE TREASURER.

I have the honor to report that the receipts to the tween the two annual meetings have amounted to the sum of \$21,723.22; the expenditures to \$20,of \$1,403.77. There is nothing further of interest to report or suggest at this time. All of which is re-RICHARD J. DUNGLISON,

Treasurer.

June 9, 1887.

He also read the report of the Librarian, which

He next read a communication from the Chairman

Dr. Davis moved to appropriate \$500. An amend-

Dr. Davis announced two resolutions which he asked should be considered on Friday morning. On motion of Dr. J. F. Hibberd, they were made the special order after the Addresses.

Dr. J. H. Hobart Burge, of Brooklyn, offered the following resolutions, which were adopted:

Resolved, That the Committees of Arrangements of the American Medical Association be expected hereafter to adopt efficient means to prevent conversation and loitering in the vestibule and all ante-rooms or the hall in which the general meetings of the Association are held.

Resolved, That it be the duty of the Permanent Secretary to place a copy of this resolution in the hands of each succeeding

Committee of Arrangements.

The Association adjourned until Friday, at 10 A.M.

FRIDAY, JUNE 10—FOURTH DAY.

The President called the Association to order at 10 A.M., and prayer was offered by Rev. W. H. Vibbert.

The Committee of Arrangements announced two charges against members; they were referred to the Jadicial Council.

The final report of the Nominating Committee was read. The following physicians were appointed to deliver addresses at the next meeting: On General Medicine, Dr. R. Beverly Cole, San Francisco, Cal.; Surgery, Dr. E. M. Moore, New York; Public Medicine, Dr. James L. Cabell, Virginia.

A committee consisting of Drs. J. M. Toner, Eugene Grissom, and Darwin Colvin, was appointed to notify those selected to deliver addresses, and in case

Surgeon General Hamilton, of the U.S. Marine prevention of vellow fever by inoculation:

George M. Sternberg, Surgeon U. S. Army, to proceed to registration officer shall provide for each registration table a Mexico and Brazil for the purpose of investigating the method there practiced for the prevention of yellow fever by inoculation;

WHEREAS, This report will be accompanied by photo-micographic illustrations of the appearance of the principal organs

of the body affected by yellow fever; therefore, be it

Resolved, That the Senate and House of Representatives be requested to cause such number of copies of Dr. Sternberg's report to be printed as may be needed by the profession of medcine of the United States; be it further resolved, that the resolution on this subject passed yesterday be resemded.

Dr. J. McF. Gaston objected that it was not in order. After some discussion, the previous question was demanded by the proper number. It was decided in the affirmative by a large vote, and the resolution of Dr. Hamilton was then adopted.

The Address on Dental and Oral Surgery was read

Section.

The Address on Medical Jurisprudence was read by Dr. I. N. Quimby, Chairman of the Section.

On motion of Dr. A. N. Bell, it was agreed that the Committees should be appointed as requested in tees for the publication of The JOURNAL, to enlarge and inthis Address.

The President appointed them as follows:

Criminality of Faticide and Measures for its Prevention-I. N. Quimby, N. J., W. B. Atkinson, Pa., W. H. Byford, Ill.

Duties Commonly Exercised by Coroners—H. O. Marcy, Mass, J. H. H. Burge, N. Y., W. W. Dawson, Ohio.

Dr. J. M. Toner reported that the necrological

notices had been published as before. The report of the Auditors was presented and ac-

cepted:

The undersigned, Auditing Committee of the ac-Association, and also of the Treasurer of the Board of Trustees, report that they have carefully examined the accounts of said officers, and find them correctly cast and properly vouched, and that the balances are as reported by said officers to the Association. In behalf of the Auditing Committee,

Alonzo Garcelon, Chairman.

Dr. Davis, of the Committee on Meteorological Investigations, etc., reported progress. On motion of Dr. Brodie, the report was accepted and the Committee continued.

Dr. Davis offered the following:

Resolved, That the regular graduates of such dental and oral schools and colleges as require of their students a standard of preliminary or general education, and a term of professional study equal to the best class of the medical colleges of this country, and embrace in their curriculum all the fundamental branches of medicine, differing chiefly by substituting practical and clinical instruction in dental and oral medicine and surgery, in place of practical and elimical instruction in general medicine and surgery, be recognized as members of the regular profession of medicine, and eligible to membership in this Association on the same conditions and subject to the same regulations as other members.

This was adopted by a large majority. Dr. N. S. Davis read the following:

Resolved, That the Committee of Airangements are hereby directed at each annual meeting of the Association, to so arrange the programmes regarding entertainments and receptions, cinnati. that the evening of the third day be reserved for a regular an-

WHEREAS. The President of the United States has appointed anual dinner under the following general regulations: The chief paper headed, "Annual Dinner of the American Medical Association," with two columns for names, one headed tickets without wines or liquors at a specified sum; the other tickets with wines, etc., at a specified sum; that each member when registering can have the opportunity to take a ticket for the dinner if he desires it, and can be entirely free to enjoy the dinner not only without using wines, but also without being required to assist in paying for that drank by others; while those who desire the addition of wines will enjoy the same liberty. It shall be the duty of the Committee of Arrangements to select a proper place for the dinner, to ascertain the cost per plate on the plan already indicated, that the price paid for the tickets will pay the entire cost of the dinner, leaving no part to be paid either by the local profession or by the Treasurer of the Association.

This was also adopted by a large majority.

Dr. A. H. Wilson, Mass., offered a resolution apby Dr. J. S. Marshall, of Illinois, Chairman of the propriating an honorarium of \$300 to the Permanent Secretary. After some discussion, Dr. Davis offered an amendment to strike out all after the word resolved, and insert the following:

> WHEREAS, It has been the unswerving policy of the Truscrease the value of THE JOURNAL as fast as the income of the

> Association will permit, therefore
>
> Resolved, That said Board of Trustees be a Standing Committee on Finance to which all propositions for the appropriation of money, made hereafter, shall be referred and reported upon before final action on the same by the Association.

> This was adopted. The vote was then taken on the resolution as amended, and it was adopted.

> Dr. D. J. Roberts offered a resolution on Medical Education, which, on motion of Dr. Brodie, was referred to the Section on State Medicine.

Dr. J. M. Toner offered a resolution that the Presidents of each State or Territorial Medical Society be an Honorary Vice-President of this Association. counts of the Treasurer of the American Medical On motion of Dr. D. J. Roberts, this was laid upon

> On motion of Dr. E. A. Wood, of Pa., the President was requested to appoint a committee of three to report on Dietetics. The President appointed as such committee Drs. E. A. Wood, of Pittsburgh, Pa., J. S. Whittaker, Cincinnati, O., and F. Woodbury, Philadelphia, Pa.

> Dr. T. E. Woodbridge, of Ohio, offered a resolution to appoint a committee to examine and report upon Sanitary Locations. On motion this was referred to the Section on State Medicine.

> The Permanent Secretary read a telegram from the President, Dr. A. Y. P. Garnett, thanking the Association for the honor conferred upon bim.

> On motion of Dr. Brodie, the thanks of the Association were tendered to the citizens and profession of Chicago, to Drs. R. N. Isham, N. S. Davis, C. Gilman Smith, and S. J. Jones, and to Mr. and Mrs. S. M. Nickerson and Mr. and Mrs. Rosenberg, and to the many who had so courteously invited the Association to enjoy their hospitalities, to the officers of the Association, and to all who had contributed to make this session a grand success.

> After some pleasant remarks from the retiring President, he declared the Association adjourned to meet on the second Tuesday of May, 1888, in Cin-WM. B. ATKINSON,

> > Permanent Secretary.
